Programming Principles in Python (CSCI 503/490)

Data

Dr. David Koop

Arrays

- Usually a fixed size—lists are meant to change size
- Are mutable—tuples are not
- Store only one type of data—lists and tuples can store anything • Are faster to access and manipulate than lists or tuples
- Can be multidimensional:

 - Can have list of lists or tuple of tuples but no guarantee on shape - Multidimensional arrays are rectangles, cubes, etc.

D. Koop, CSCI 503/490, Fall 2022

2

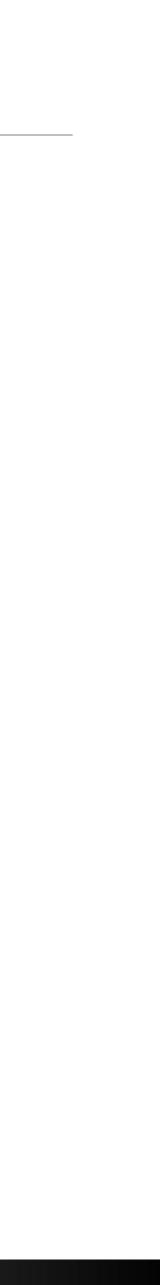

NumPy Arrays

- import numpy as np
- Creating:
 - data1 = [6, 7, 8, 0, 1]
 - arr1 = np.array(data1)

 - arr1 float = np.array(data1, dtype='float64') - np.ones((4,2)) # 2d array of ones - arr1 ones = np.ones like(arr1) # [1, 1, 1, 1, 1]
- Type and Shape Information:
 - arr1.dtype # int64 # type of values stored in array - arr1.ndim # 1 # number of dimensions

 - arr1.shape # (5,) # shape of the array

Array Operations

- a = np.array([1, 2, 3])b = np.array([6, 4, 3])
- (Array, Array) Operations (**Element-wise**)
 - Addition, Subtraction, Multiplication
 - -a + b # array([7, 6, 6])
- (Scalar, Array) Operations (**Broadcasting**):
 - Addition, Subtraction, Multiplication, Division, Exponentiation
 - a ** 2 # array([1, 4, 9])
 - -b + 3 # array([9, 7, 6])

More on Array Creation

- Zeros: np.zeros(10)
- Ones: np.ones((4,5)) # shape
- Empty: np.empty((2,2))
- _like versions: pass an existing array and matches shape with specified contents
- Range: np.arange(15) # constructs an array, not iterator!

Assignment 7

- Coming Soon...
- Downloading and finding files
- Processing data

Teaching Evaluations

• This Tuesday (November 15) in class

Indexing

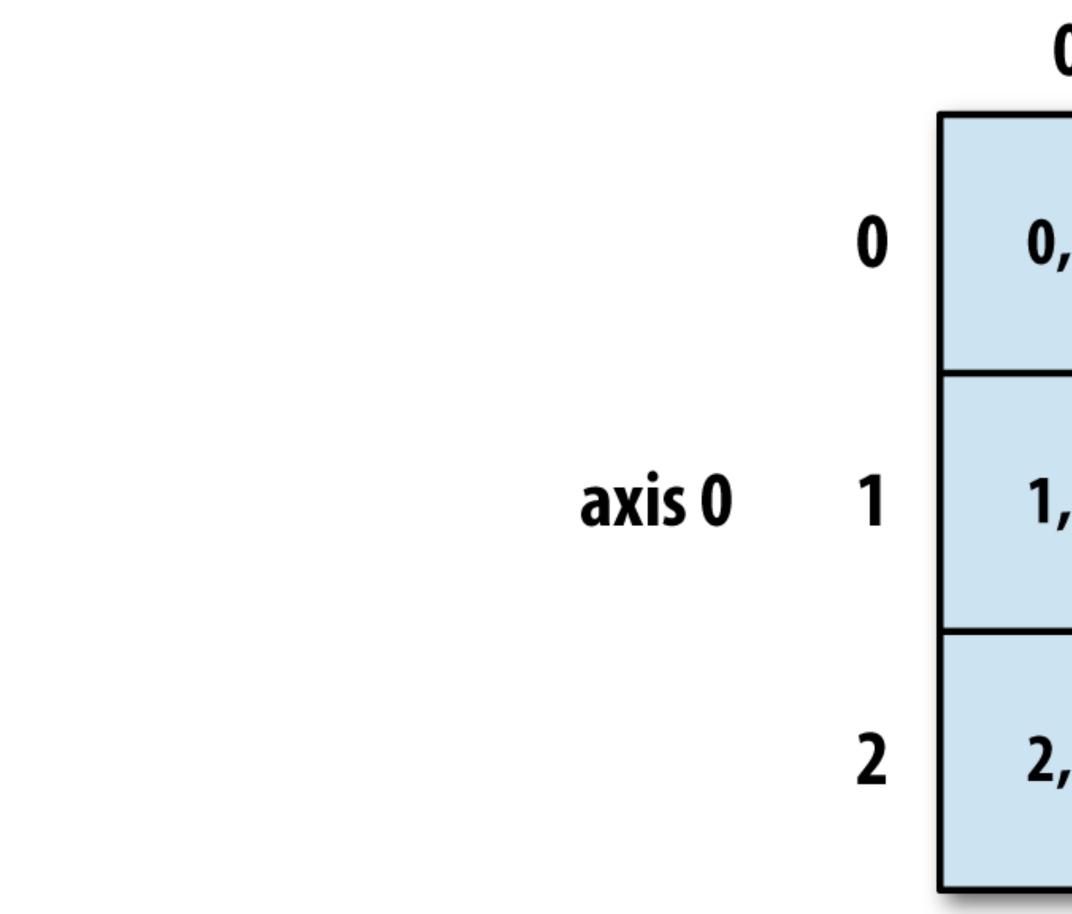

- Same as with lists plus shorthand for 2D+
 - $\operatorname{arr1} = \operatorname{np.array}([6, 7, 8, 0, 1])$
 - arr1[1]
 - arr1[-1]
- What about two dimensions?
 - $\operatorname{arr2} = \operatorname{np.array}([[1.5, 2, 3, 4], [5, 6, 7, 8]])$
 - arr[1][1]
 - arr[1,1] # shorthand

2D Indexing

D. Koop, CSCI 503/490, Fall 2022

	axis 1	
0	1	2
,0	0, 1	0, 2
, 0	1, 1	1, 2
,0	2, 1	2, 2

[W. McKinney, Python for Data Analysis]

Slicing

- 1D: Similar to lists
 - arr1 = np.array([6, 7, 8, 0, 1])
 - arr1[2:5] # np.array([8, 0, 1]), sort of
- Can **mutate** original array:
 - arr1[2:5] = 3 # supports assignment
 - arr1 # the original array changed
- Slicing returns views (copy the array if original array shouldn't change)
 - arr1[2:5] # a view
 - arr1[2:5].copy() # a new array

Slicing

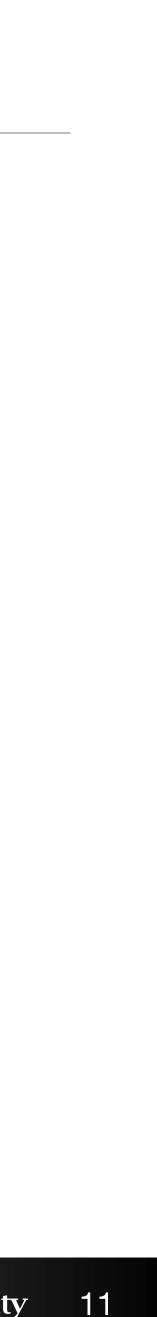

- 2D+: comma separated indices as shorthand:
 - arr2 = np.array([[1.5,2,3,4],[5,6,7,8]])
 - a[1:3,1:3]
 - a[1:3,:] # works like in single-dimensional lists
- Can combine index and slice in different dimensions
 - a[1,:] # gives a row
 - a[:,1] # gives a column

D. Koop, CSCI 503/490, Fall 2022

shorthand: 4], [5, 6, 7, 8]])

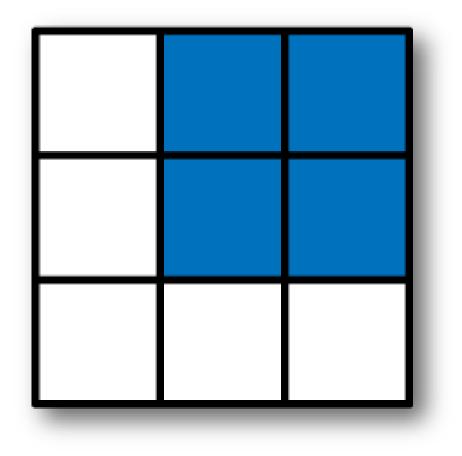

ingle-dimensional lists erent dimensions

How to obtain the blue slice from array arr?

D. Koop, CSCI 503/490, Fall 2022

[W. McKinney, Python for Data Analysis]

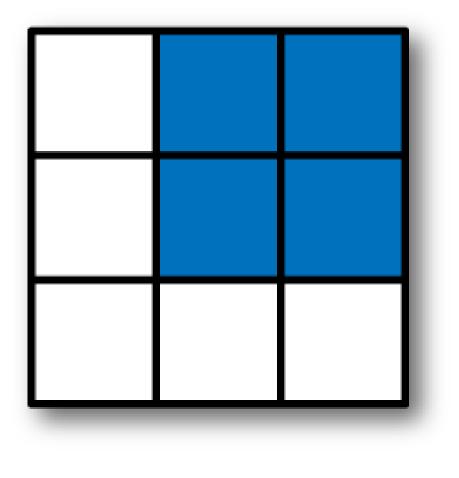

Northern Illinois University

12

How to obtain the blue slice from array arr?

D. Koop, CSCI 503/490, Fall 2022

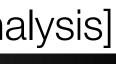

arr[:2,1:]

How to obtain the blue slice from array arr?

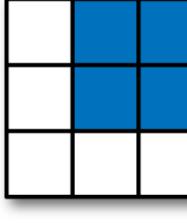

D. Koop, CSCI 503/490, Fall 2022

14

How to obtain the blue slice from array arr?

D. Koop, CSCI 503/490, Fall 2022

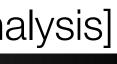

Expression	Shape	
arr[:2, 1:]	(2,2)	
arr[2]	(3,)	
arr[2, :]	(3,)	

(1, 3)

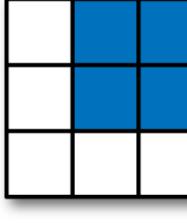

arr[2:, :]

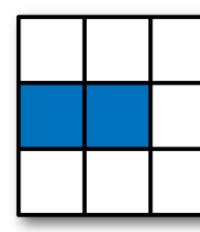

[W. McKinney, Python for Data Analysis]

14

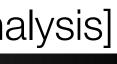

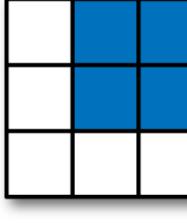

How to obtain the blue slice from array arr?

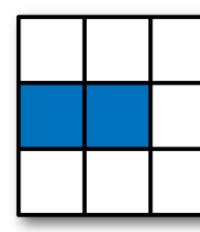

D. Koop, CSCI 503/490, Fall 2022

[W. McKinney, Python for Data Analysis]

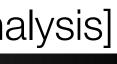

How to obtain the blue slice from array arr?

D. Koop, CSCI 503/490, Fall 2022

Expression	Shape
arr[:2, 1:]	(2, 2)
arr[2]	(3,)
arr[2, :]	(3,)
arr[2:, :]	(1, 3)
arr[:, :2]	(3, 2)
arr[1, :2]	(2,)
arr[1:2, :2]	(1, 2)

[W. McKinney, Python for Data Analysis]

More Reshaping

- reshape:
 - arr2.reshape(4,2) # returns new view
- resize:
 - arr2.resize(4,2) # no return, modifies arr2 in place
- flatten:
 - arr2.flatten() # array([1.5,2.,3.,4.,5.,6.,7.,8.])
- ravel:
 - arr2.ravel() # array([1.5,2.,3.,4.,5.,6.,7.,8.])
- flatten and ravel look the same, but ravel is a view

Array Transformations

- Transpose
 - arr2.T # flip rows and columns
- Stacking: take iterable of arrays and stack them horizontally/vertically
 - $\operatorname{arrh1} = \operatorname{np.arange}(3)$
 - $\operatorname{arrh2} = \operatorname{np.arange}(3, 6)$
 - np.vstack([arrh1, arrh2])
 - np.hstack([arr1.T, arr2.T]) # ???

Boolean Indexing

- names == 'Bob' gives back booleans that represent the element-wise comparison with the array names
- Boolean arrays can be used to index into another array:
 - data[names == 'Bob']
- Can even mix and match with integer slicing
- Can do boolean operations (&, |) between arrays (just like addition, subtraction)
 - data[(names == 'Bob') | (names == 'Will')]
- Note: or and and do not work with arrays
- We can set values too! data [data < 0] = 0

pandas

- Contains high-level data structures and manipulation tools designed to make data analysis fast and easy in Python
- Built on top of NumPy
- Built with the following requirements:
 - Data structures with labeled axes (aligning data)
 - Support time series data
 - Do arithmetic operations that include metadata (labels)
 - Handle missing data
 - Add merge and relational operations

Pandas Code Conventions

- Universal:
 - import pandas as pd
- Also used:
 - from pandas import Series, DataFrame

Series

- A one-dimensional array (with a type) with an **index**
- Index defaults to numbers but can also be text (like a dictionary)
- Allows easier reference to specific items
- obj = pd.Series([7,14,-2,1])
- Basically two arrays: obj.values and obj.index
- Can specify the index explicitly and use strings
- obj2 = pd.Series([4, 7, -5, 3])index=['d', 'b', 'a', 'c'])
- Kind of like fixed-length, ordered dictionary + can create from a dictionary
- obj3 = pd.Series({'Ohio': 35000, 'Texas': 71000,

D. Koop, CSCI 503/490, Fall 2022

'Oregon': 16000, 'Utah': 5000})

Series

- Indexing: s[1] Or s['Oregon']
- Can check for missing data: pd.isnull(s) Or pd.notnull(s)
- Both index and values can have an associated name:
 - s.name = 'population'; s.index.name = 'state'
- Addition and NumPy ops work as expected and preserve the index-value link
- Arithmetic operations **align**:

In [28]: Out[28]:	•	In [29]: obj Out[29]:	4	In [30]: obj Out[30]:	3 + obj4
Ohio	35000	California	NaN	California	NaN
Oregon	16000	Ohio	35000	Ohio	70000
Texas	71000	Oregon	16000	Oregon	32000
Utah	5000	Texas	71000	Texas	142000
dtype: i	nt64	dtype: float	64	Utah	NaN
71				dtype: float	64
				[VV. N	AcKinney, Pytł

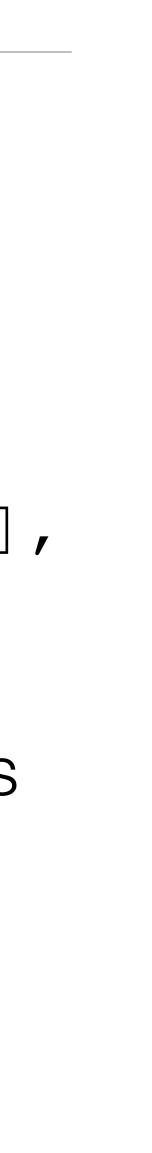

- A dictionary of Series (labels for each series) A spreadsheet with row keys (the index) and column headers
- Has an index shared with each series
- Allows easy reference to any cell
- df = DataFrame({'state': ['Ohio', 'Ohio', 'Ohio', 'Nevada'], 'year': [2000, 2001, 2002, 2001], 'pop': [1.5, 1.7, 3.6, 2.4]})
- Index is automatically assigned just as with a series but can be passed in as well via index kwarg
- Can reassign column names by passing columns kwarg

DataFrame Constructor Inputs

Type

2D ndarray dict of arrays, lists, or tuples NumPy structured/record array dict of Series

dict of dicts

list of dicts or Series

List of lists or tuples Another DataFrame

NumPy MaskedArray

Notes

Treated as the "dict of arrays" case

Series" case.

DataFrame's column labels

Treated as the "2D ndarray" case

D. Koop, CSCI 503/490, Fall 2022

- A matrix of data, passing optional row and column labels
- Each sequence becomes a column in the DataFrame. All sequences must be the same length.
- Each value becomes a column. Indexes from each Series are unioned together to form the result's row index if no explicit index is passed.
- Each inner dict becomes a column. Keys are unioned to form the row index as in the "dict of
- Each item becomes a row in the DataFrame. Union of dict keys or Series indexes become the
- The DataFrame's indexes are used unless different ones are passed
- Like the "2D ndarray" case except masked values become NA/missing in the DataFrame result

[W. McKinney, Python for Data Analysis]

DataFrame Access and Manipulation

- df.values \rightarrow 2D NumPy array
- Accessing a column:
 - df["<column>"]
 - df.<column>
 - Both return Series
 - Dot syntax only works when the column is a valid identifier
- Assigning to a column:
 - df["<column>"] = <scalar> # all cells set to same value
 - df["<column>"] = <array> # values set in order
 - df["<column>"] = <series> # values set according to match between df and series indexes

<pre>df = pd.read_csv('penguins_lter.csv')</pre>
