### Data Visualization (CSCI 627/490)

Tabular Data

Dr. David Koop

#### Visual Encoding

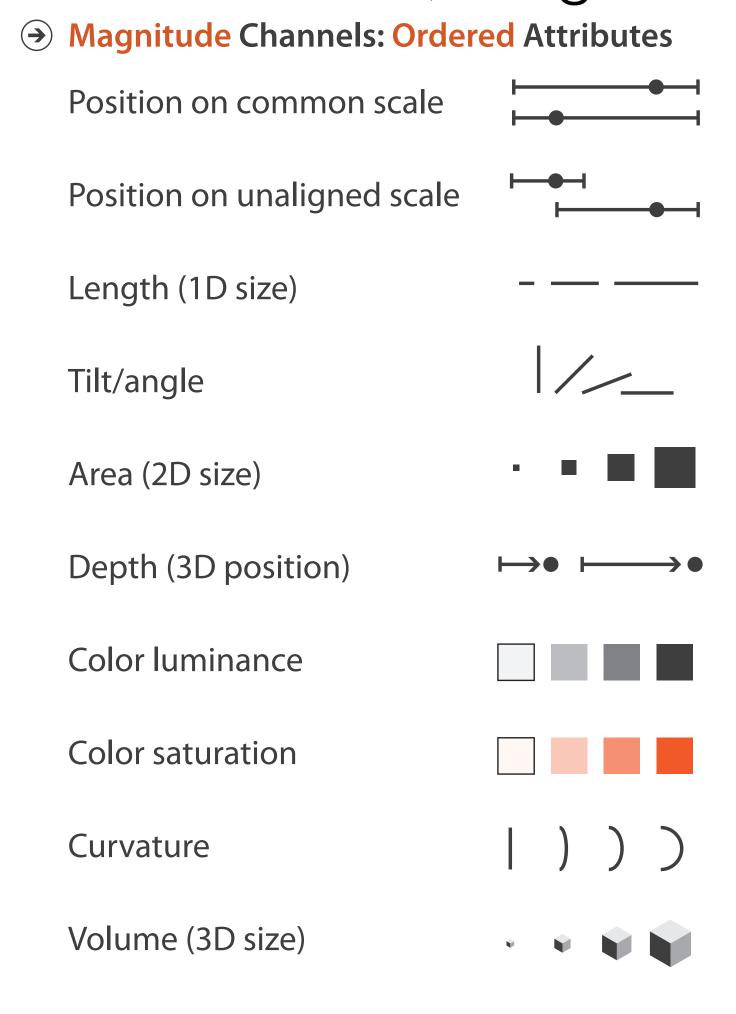

- How do we encode data visually?
  - Marks are the basic graphical elements in a visualization
  - Channels are ways to control the appearance of the marks
- Marks classified by dimensionality:

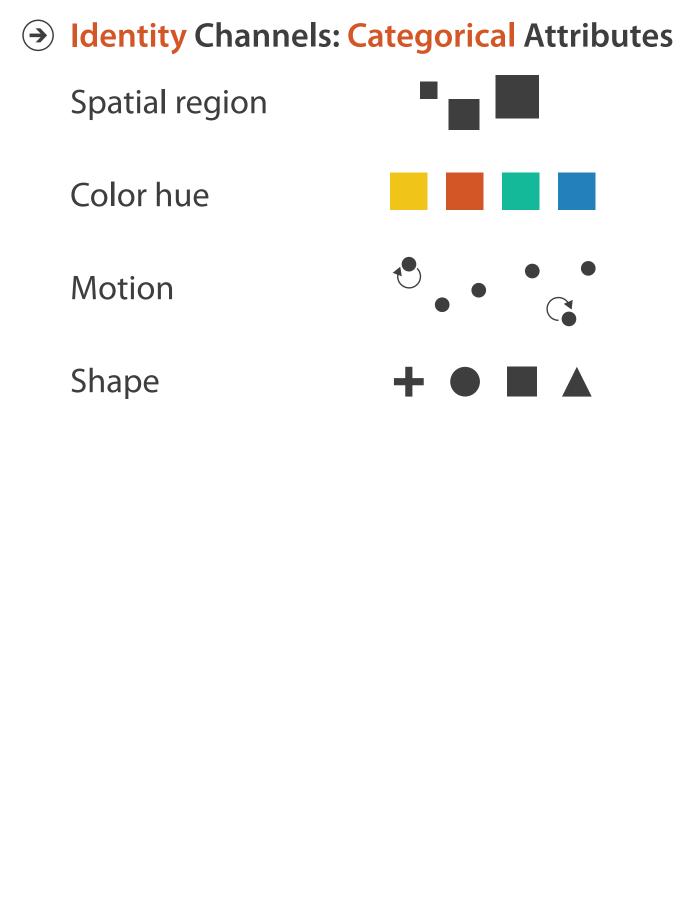

- Also can have surfaces, volumes
- Think of marks as a mathematical definition, or if familiar with tools like Adobe Illustrator or Inkscape, the path & point definitions

#### Channel Types

Identity => what or where, Magnitude => how much

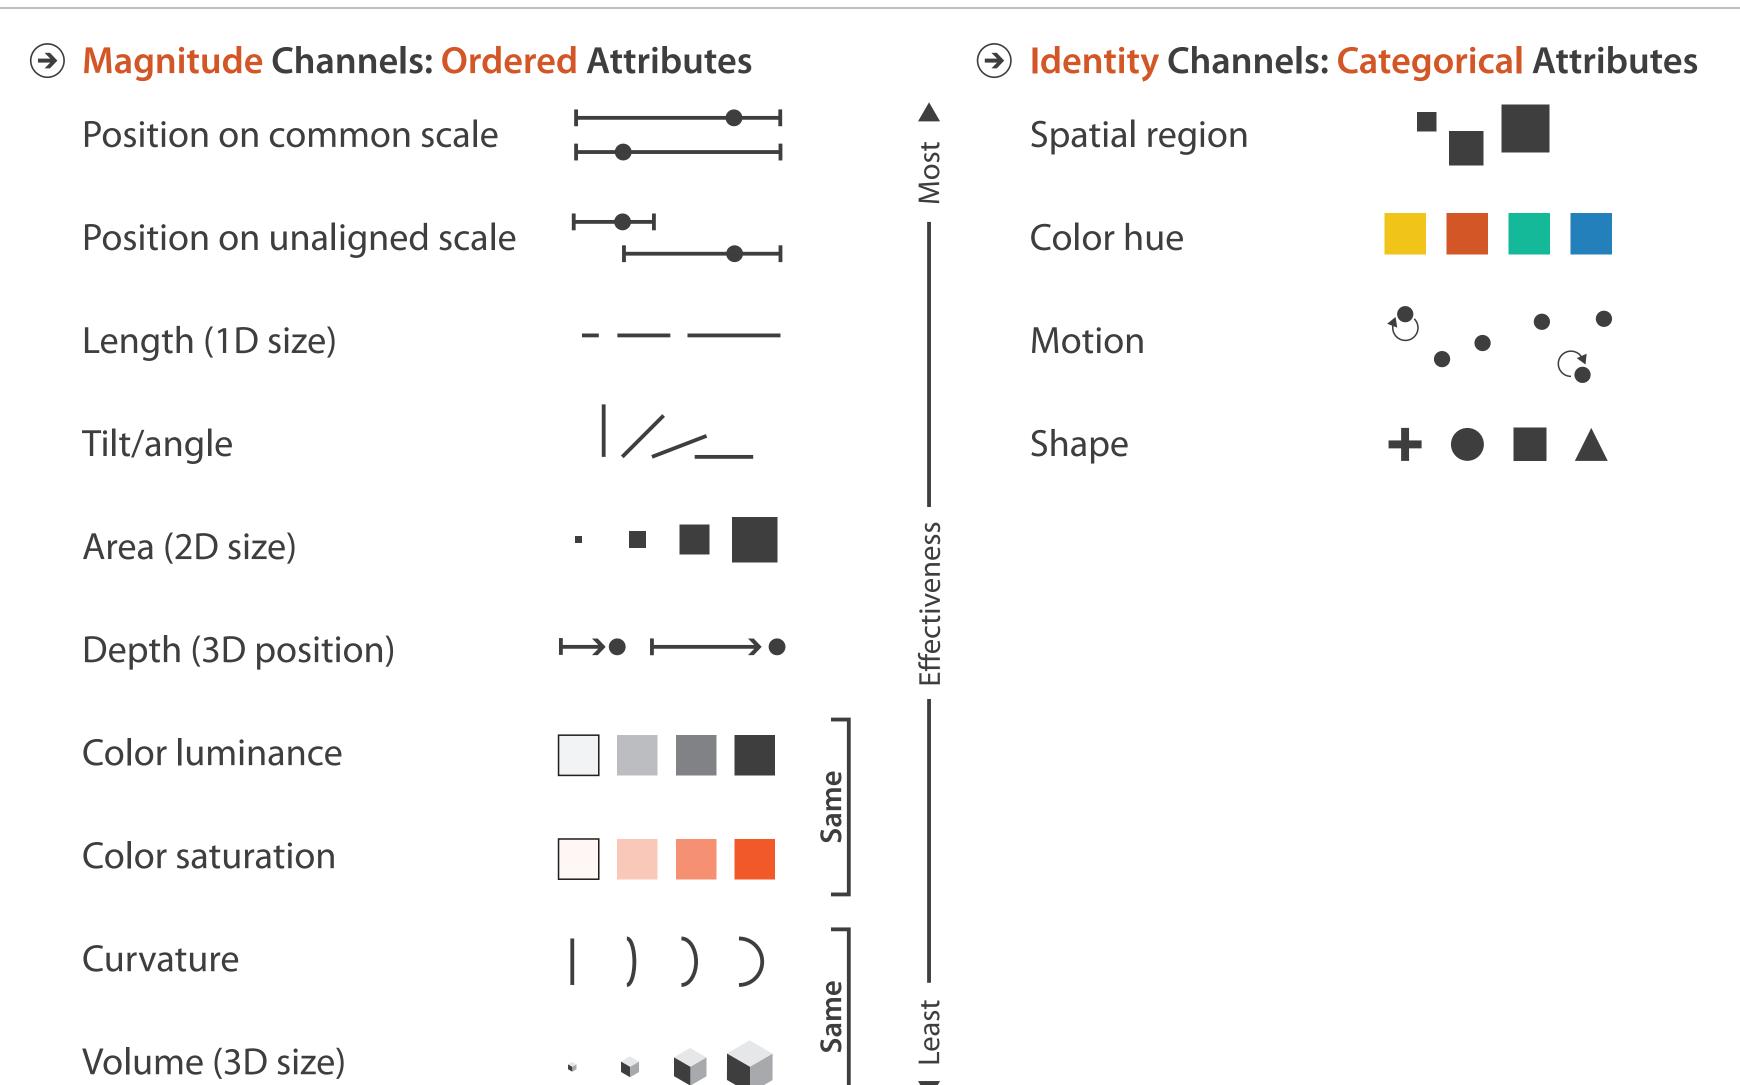

[Munzner (ill. Maguire), 2014]

#### Expressiveness and Effectiveness

- Expressiveness Principle: all data from the dataset and nothing more should be shown
  - Do encode ordered data in an ordered fashion
  - Don't encode categorical data in a way that implies an ordering
- Effectiveness Principle: the most important attributes should be the most salient
  - Saliency: how noticeable something is
  - How do the channels we have discussed measure up?

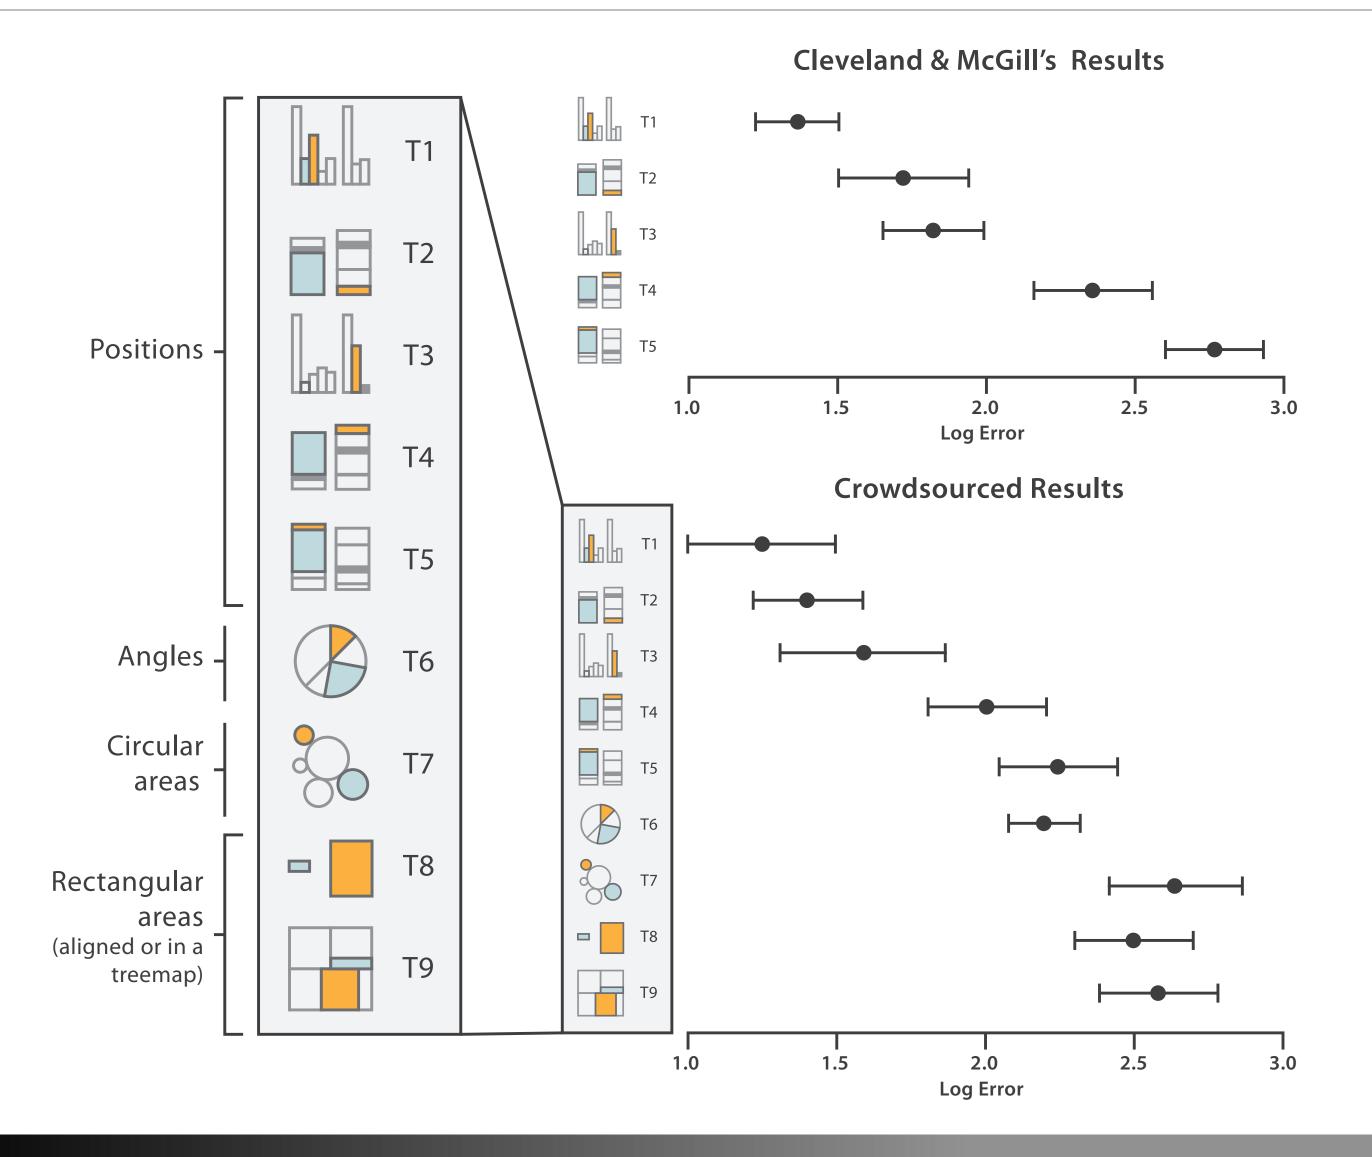

# Ranking Channels by Effectiveness

[Munzner (ill. Maguire), 2014]

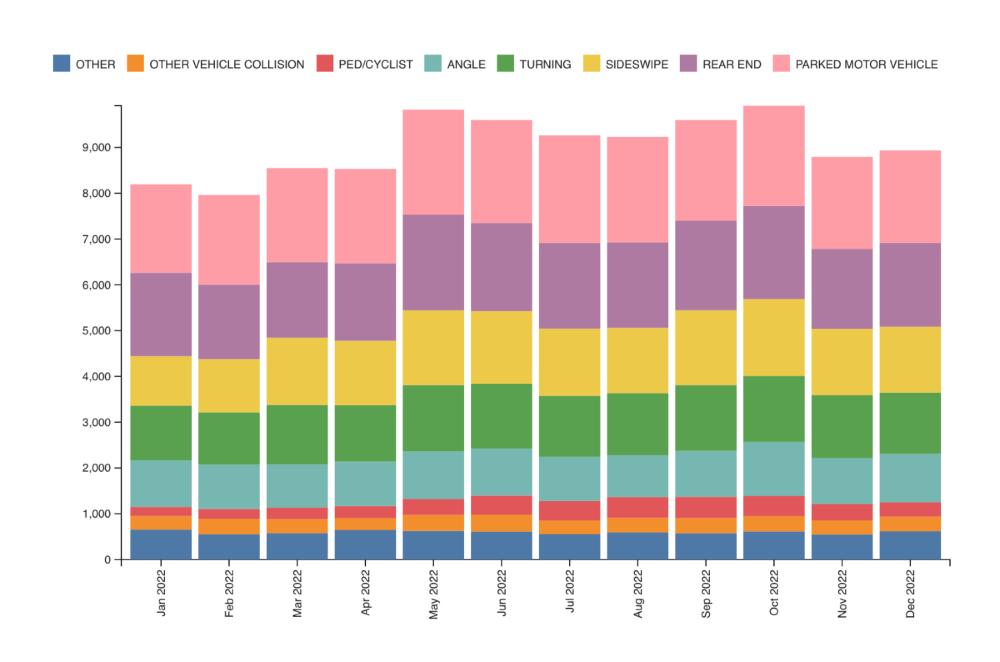

How was this determined?

### Perception Studies Summary

[Munzner (ill. Maguire) based on Heer & Bostock, 2014]

### Assignment 3

- Chicago Traffic Crashes
- Create the same stacked bar chart using
  - Tableau Public
  - Observable Plot
  - D3
- D3 Stacked Bar Chart:
  - Required for CSCI 627 students
  - CSCI 490 students can just do counts

Emergency Alert Test at 1:20pm

#### Project

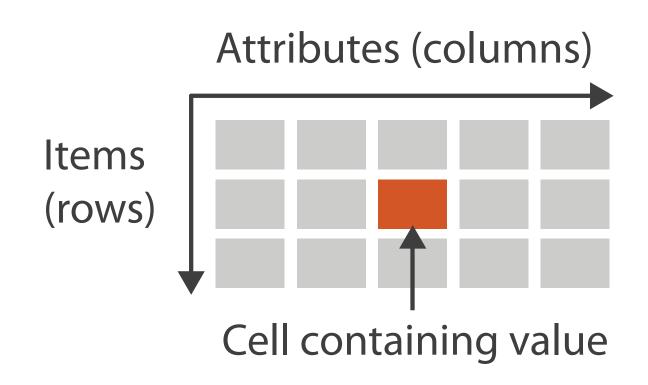

- Start thinking about project dataset and questions
- Working on posting some example datasets
- Goal: Less explored datasets (more opportunity for design/questions)
- If you are doing research and can tie this project in, please talk with me

### Tables

#### Visualization of Tables

- Items and attributes
- For now, attributes are not known to be positions
- Keys and values
  - **key** is an independent attribute that is unique and identifies item
  - value tells some aspect of an item
- Keys: categorical/ordinal
- Values: categorical/ordinal/quantitative
- Levels: unique values of categorical or ordered attributes

#### → Multidimensional Table

[Munzner (ill. Maguire), 2014]

### Arrange Tables

**Express Values** 

Separate, Order, Align Regions

- → Separate
- → Order

→ Align

→ 1 Key List

→ 2 Keys

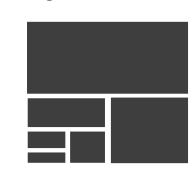

→ 3 Keys

**Layout Density** 

→ Dense

→ Space-Filling

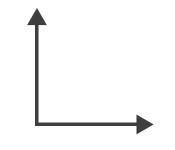

→ Many Keys Recursive Subdivision

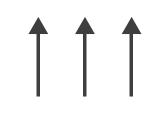

**Axis Orientation** 

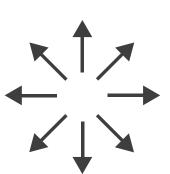

→ Rectilinear

→ Parallel

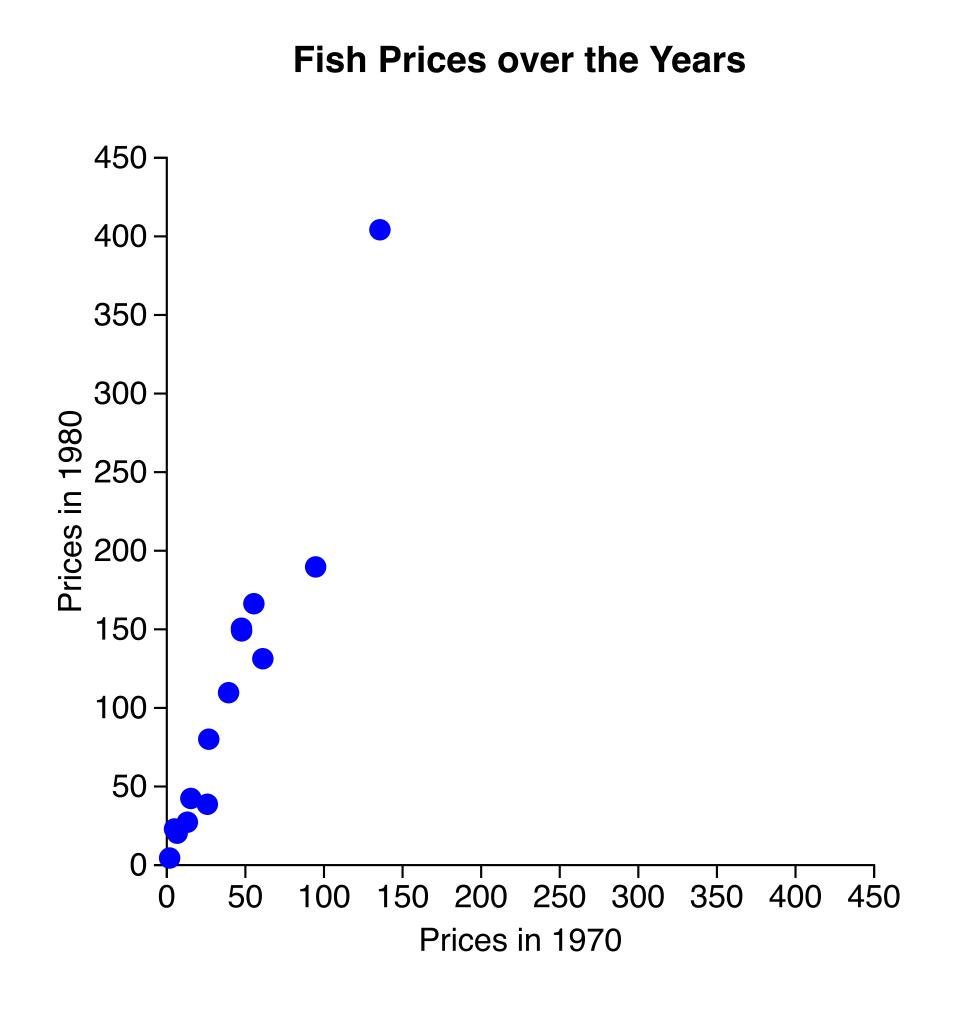

→ Radial

[Munzner (ill. Maguire), 2014]

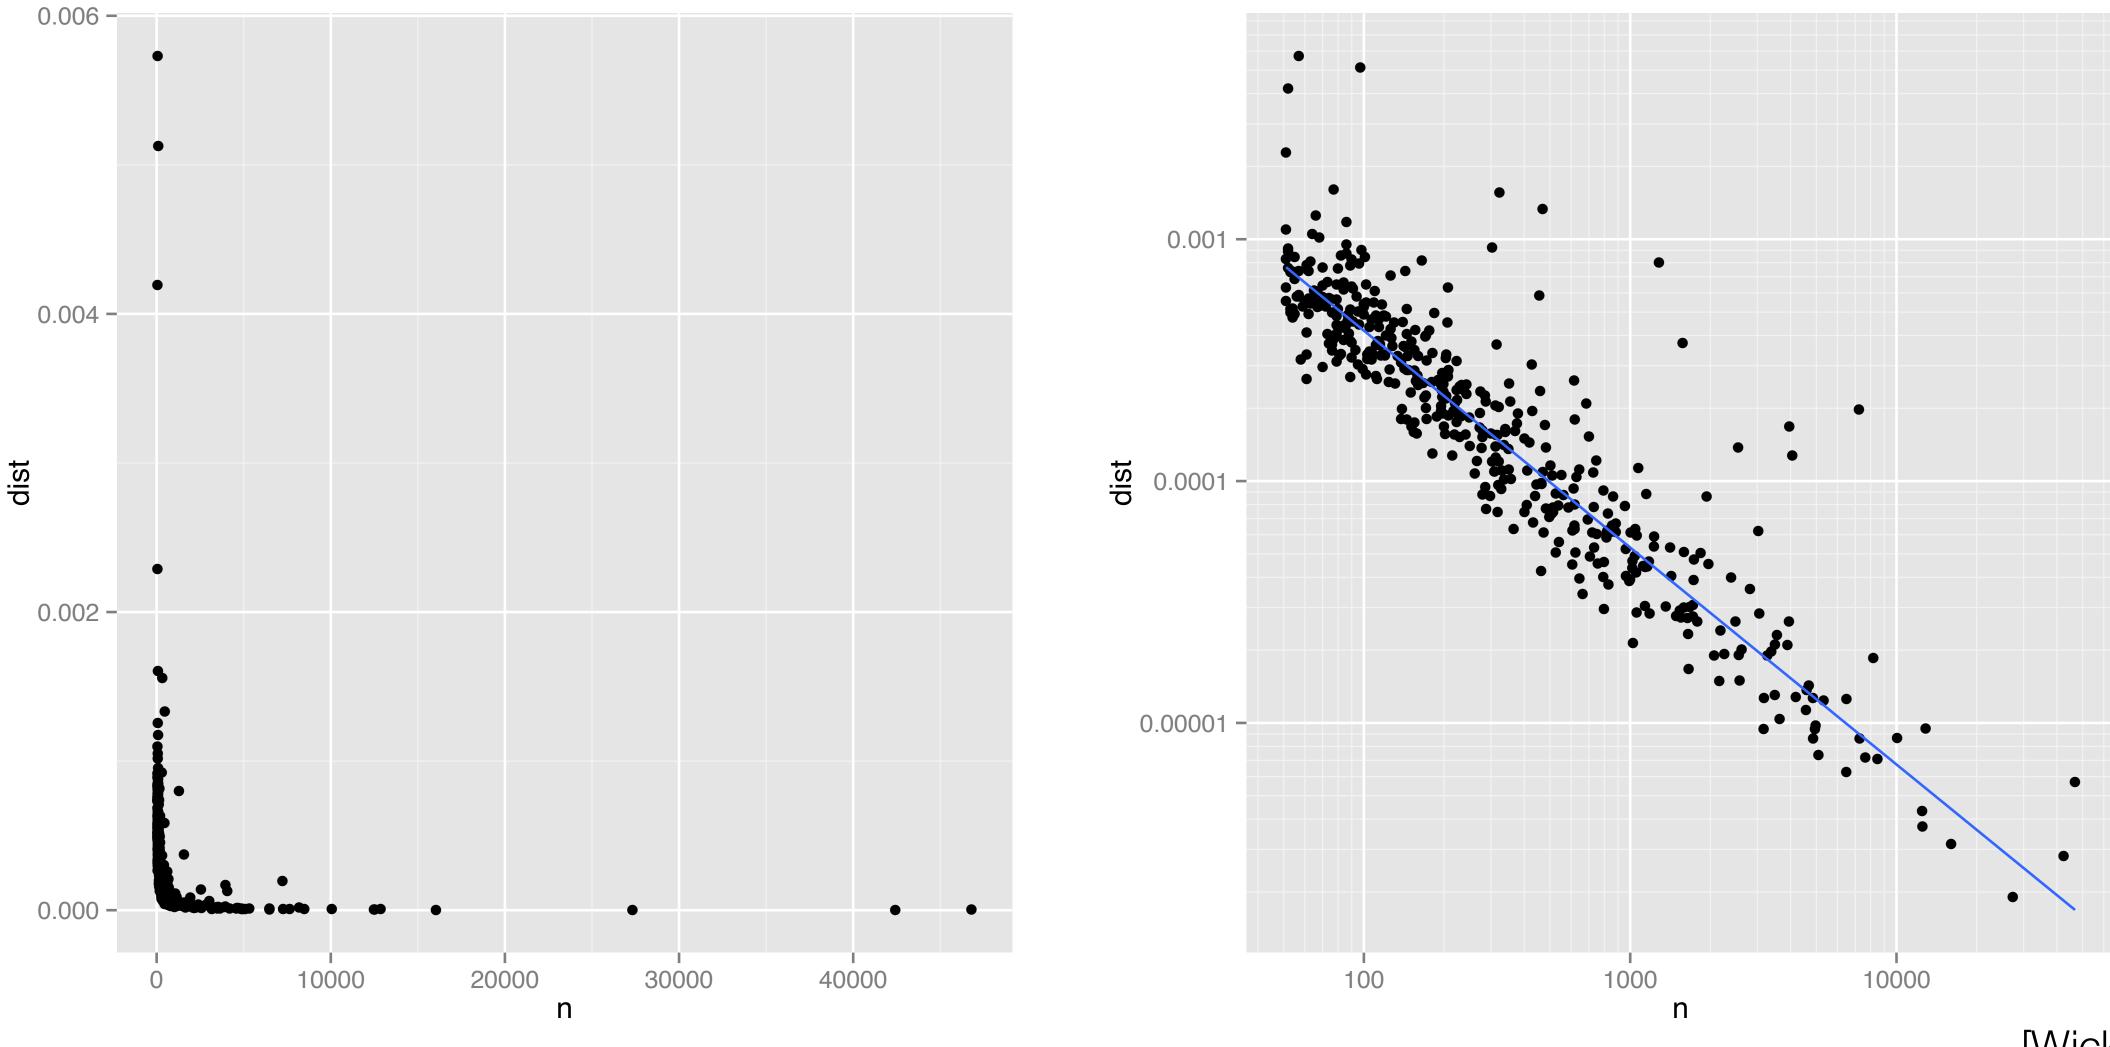

#### Express Values: Scatterplots

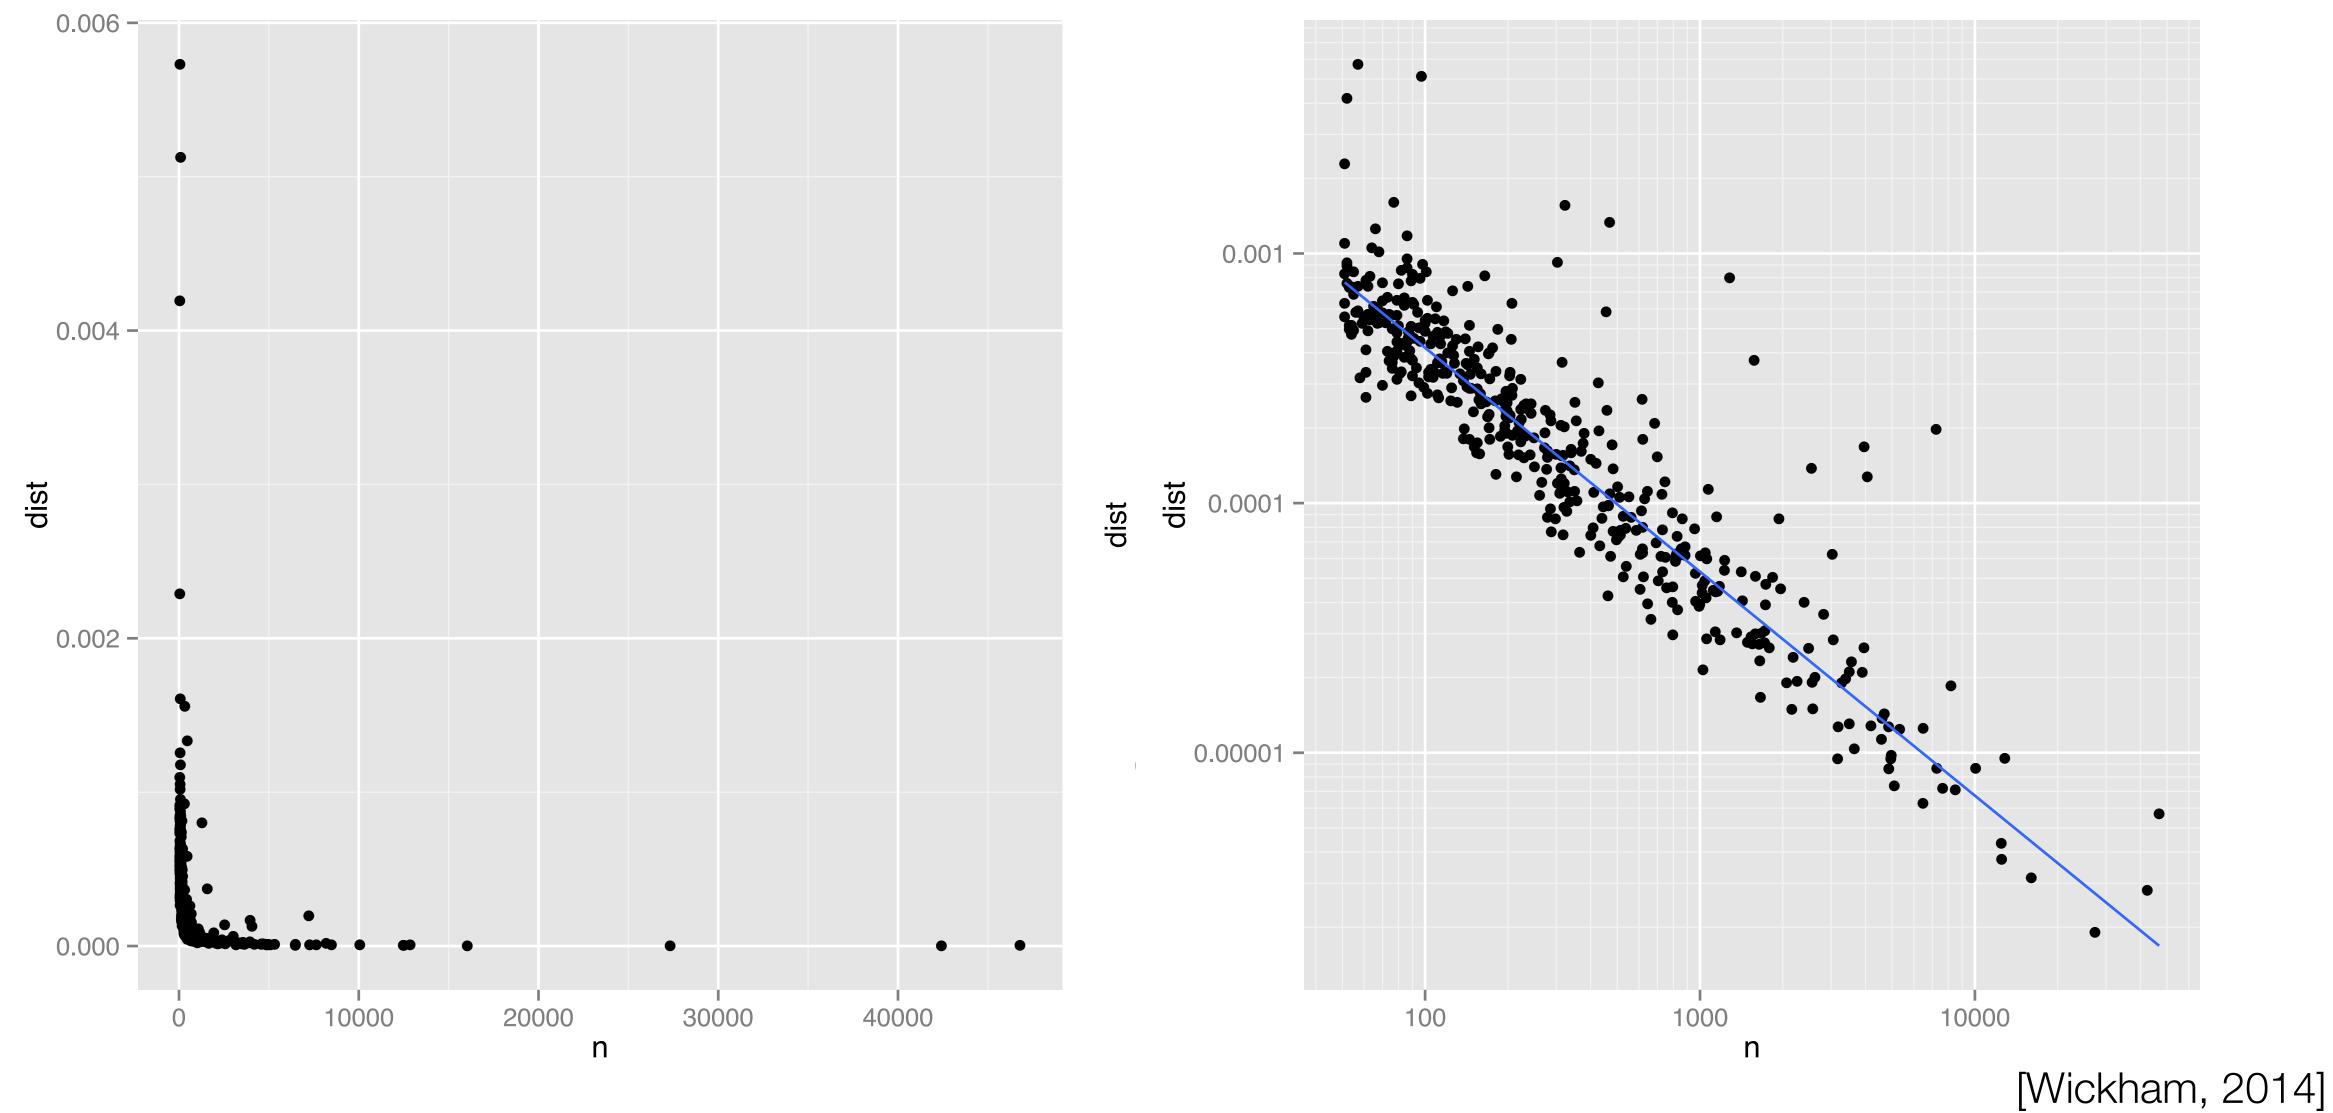

- Data: two quantitative values
- Task: find trends, clusters, outliers
- How: marks at spatial position in horizontal and vertical directions

- Correlation: dependence between two attributes
  - Positive and negative correlation
  - Indicated by lines
- Coordinate system (axes) and labels are important!

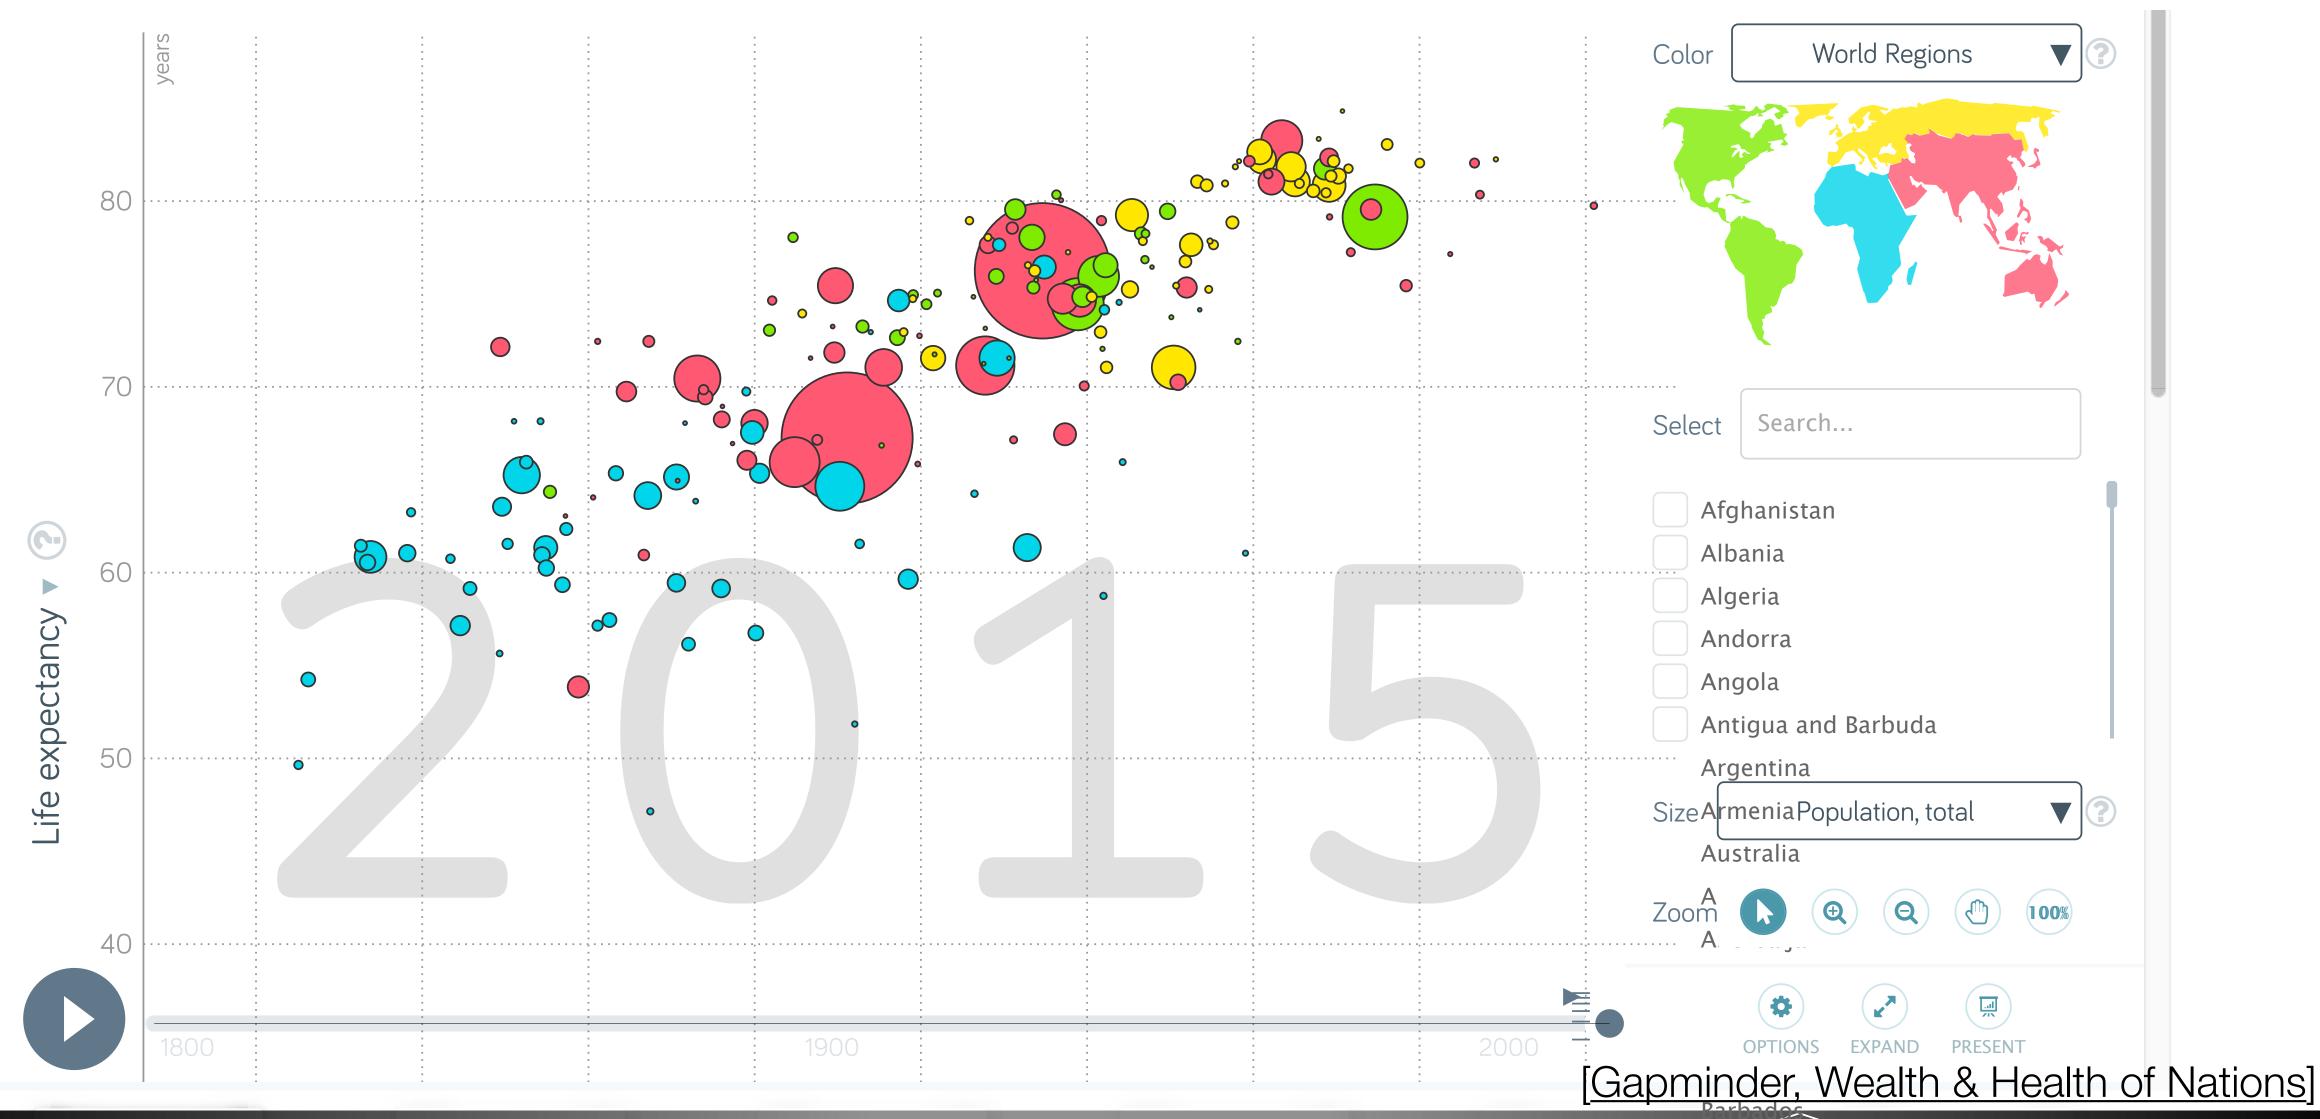

# Coordinate Systems

# Coordinate Systems

# Bubble Plot

#### Scatterplot

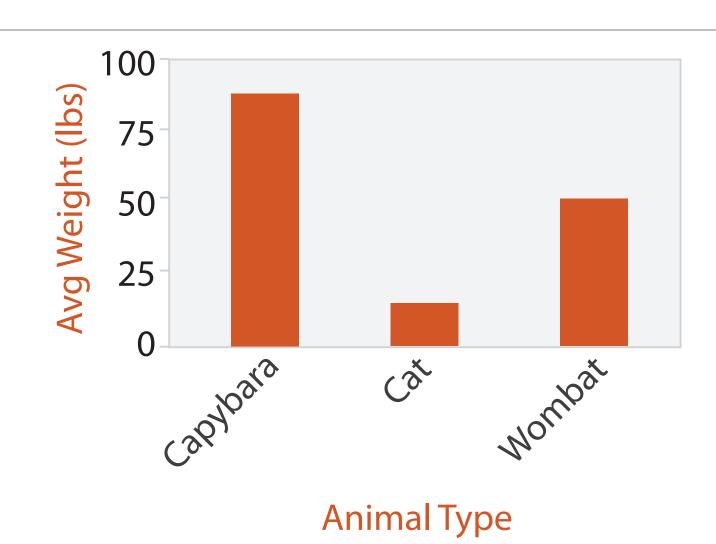

- Data: two quantitative values
- Task: find trends, clusters, outliers
- How: marks at spatial position in horizontal and vertical directions
- Scalability: hundreds of items
- "Ranking Visualizations of Correlation Using Weber's Law", 2014:
  - Correlation perception can be modeled via Weber's Law
  - Scatterplots are one of the best visualizations for both positive and negative correlation
  - Further analysis: M. Kay and J. Heer, "Beyond Weber's Law", 2015

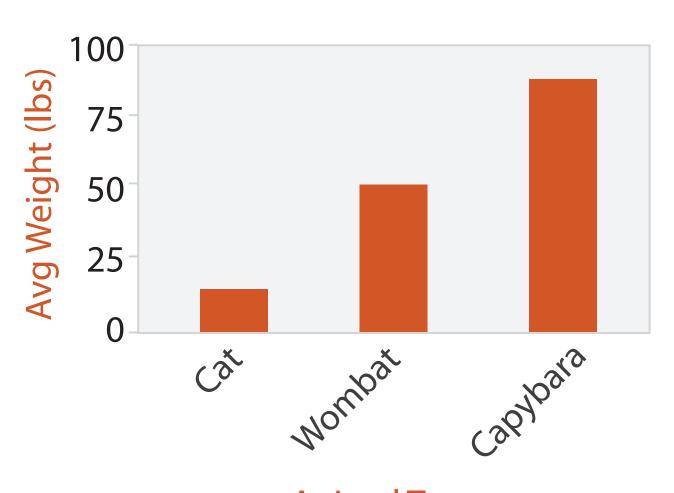

# Separate, Order, and Align: Categorical Regions

- Categorical: =, !=
- Spatial position can be used for categorical attributes
- Use **regions**, distinct contiguous bounded areas, to encode categorical attributes
- Three operations on the regions:
  - Separate (use categorical attribute)
  - Align (use some other ordered attribute)
  - Order
- Alignment and order can use same or different attribute

#### List Alignment: Bar Charts

- Data: one quantitative attribute, one categorical attribute
- Task: lookup & compare values
- How: line marks, vertical position (quantitative), horizontal position (categorical)
- What about length?
- Ordering criteria: alphabetical or using quantitative attribute
- Scalability: distinguishability
  - bars at least one pixel wide
  - hundreds

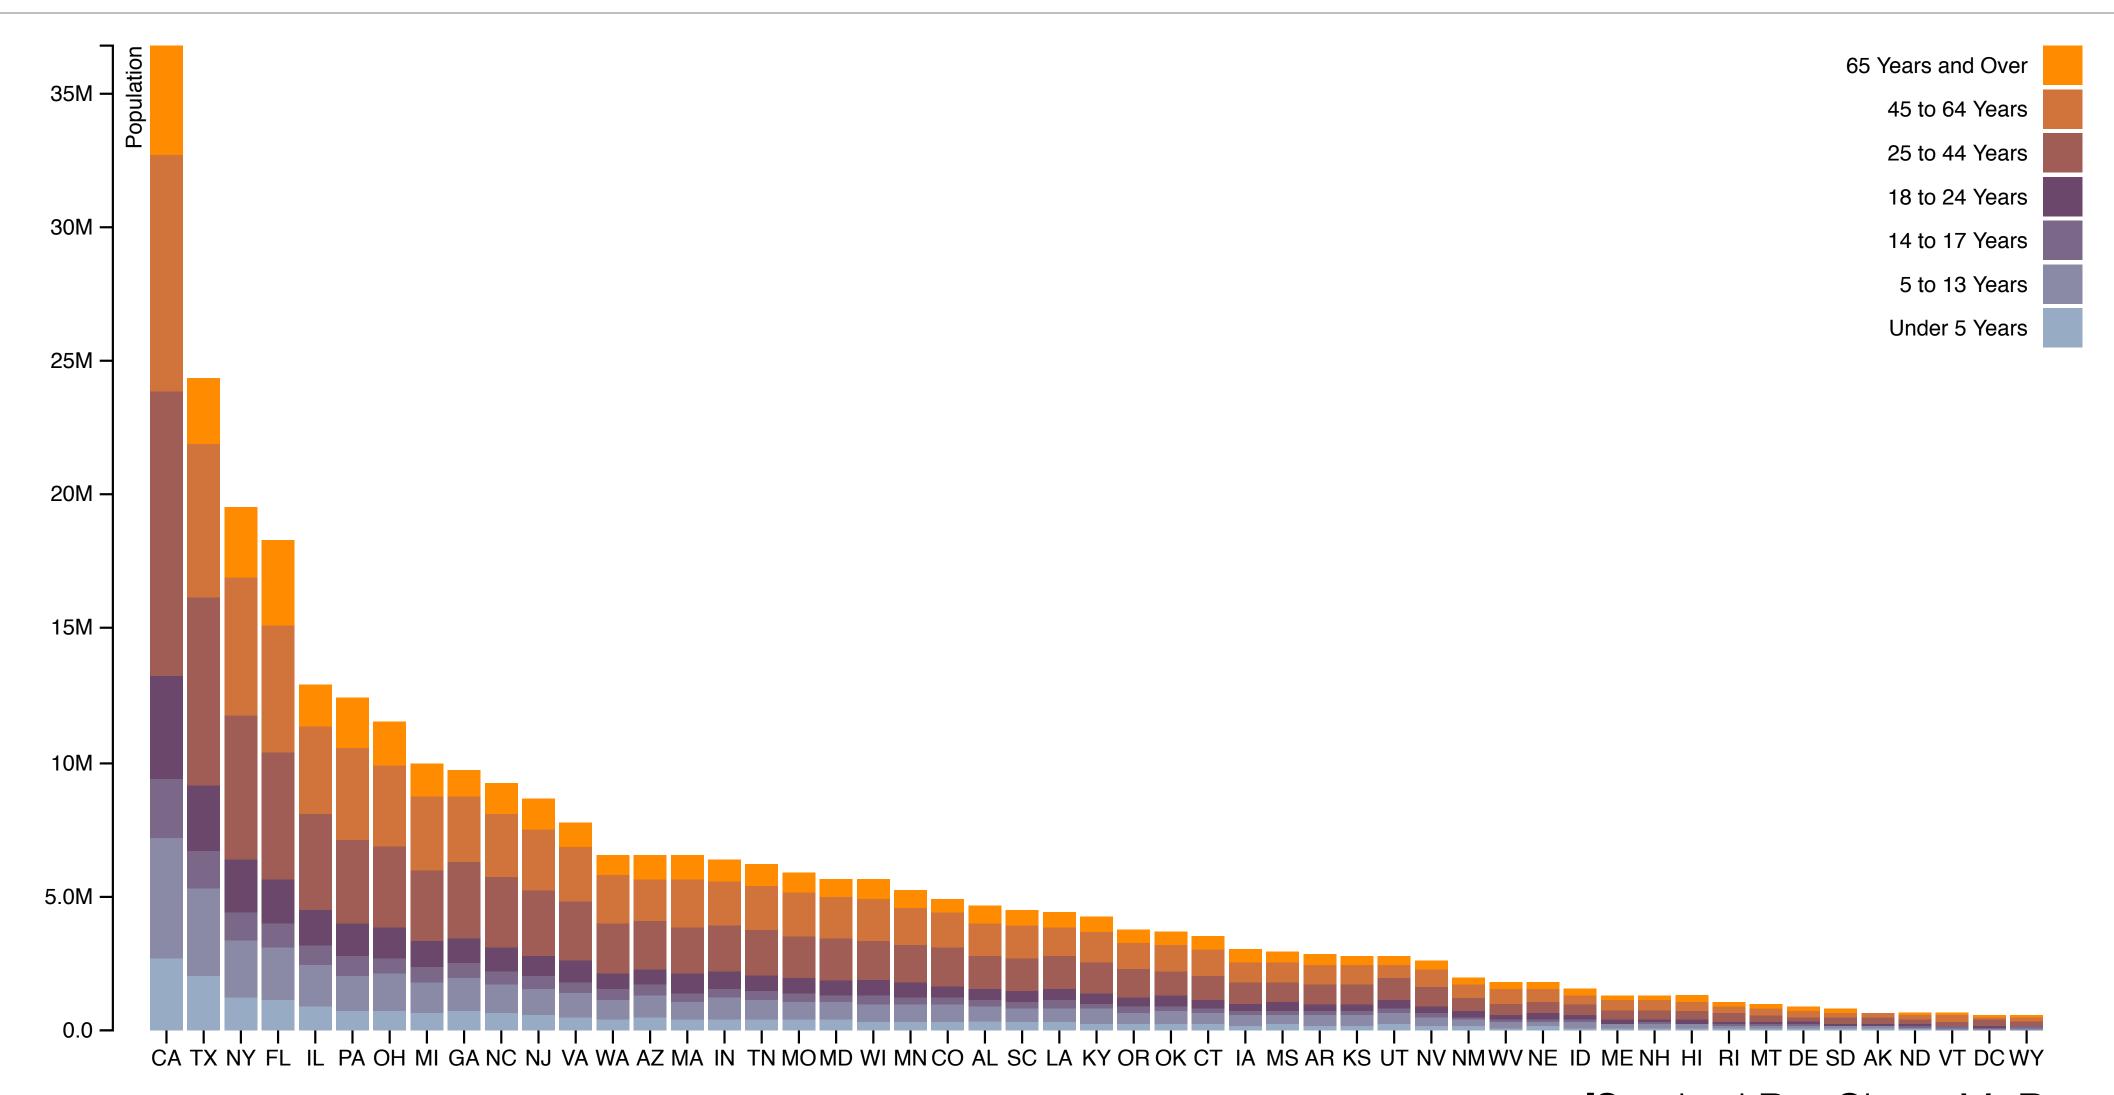

Animal Type

[Munzner (ill. Maguire), 2014]

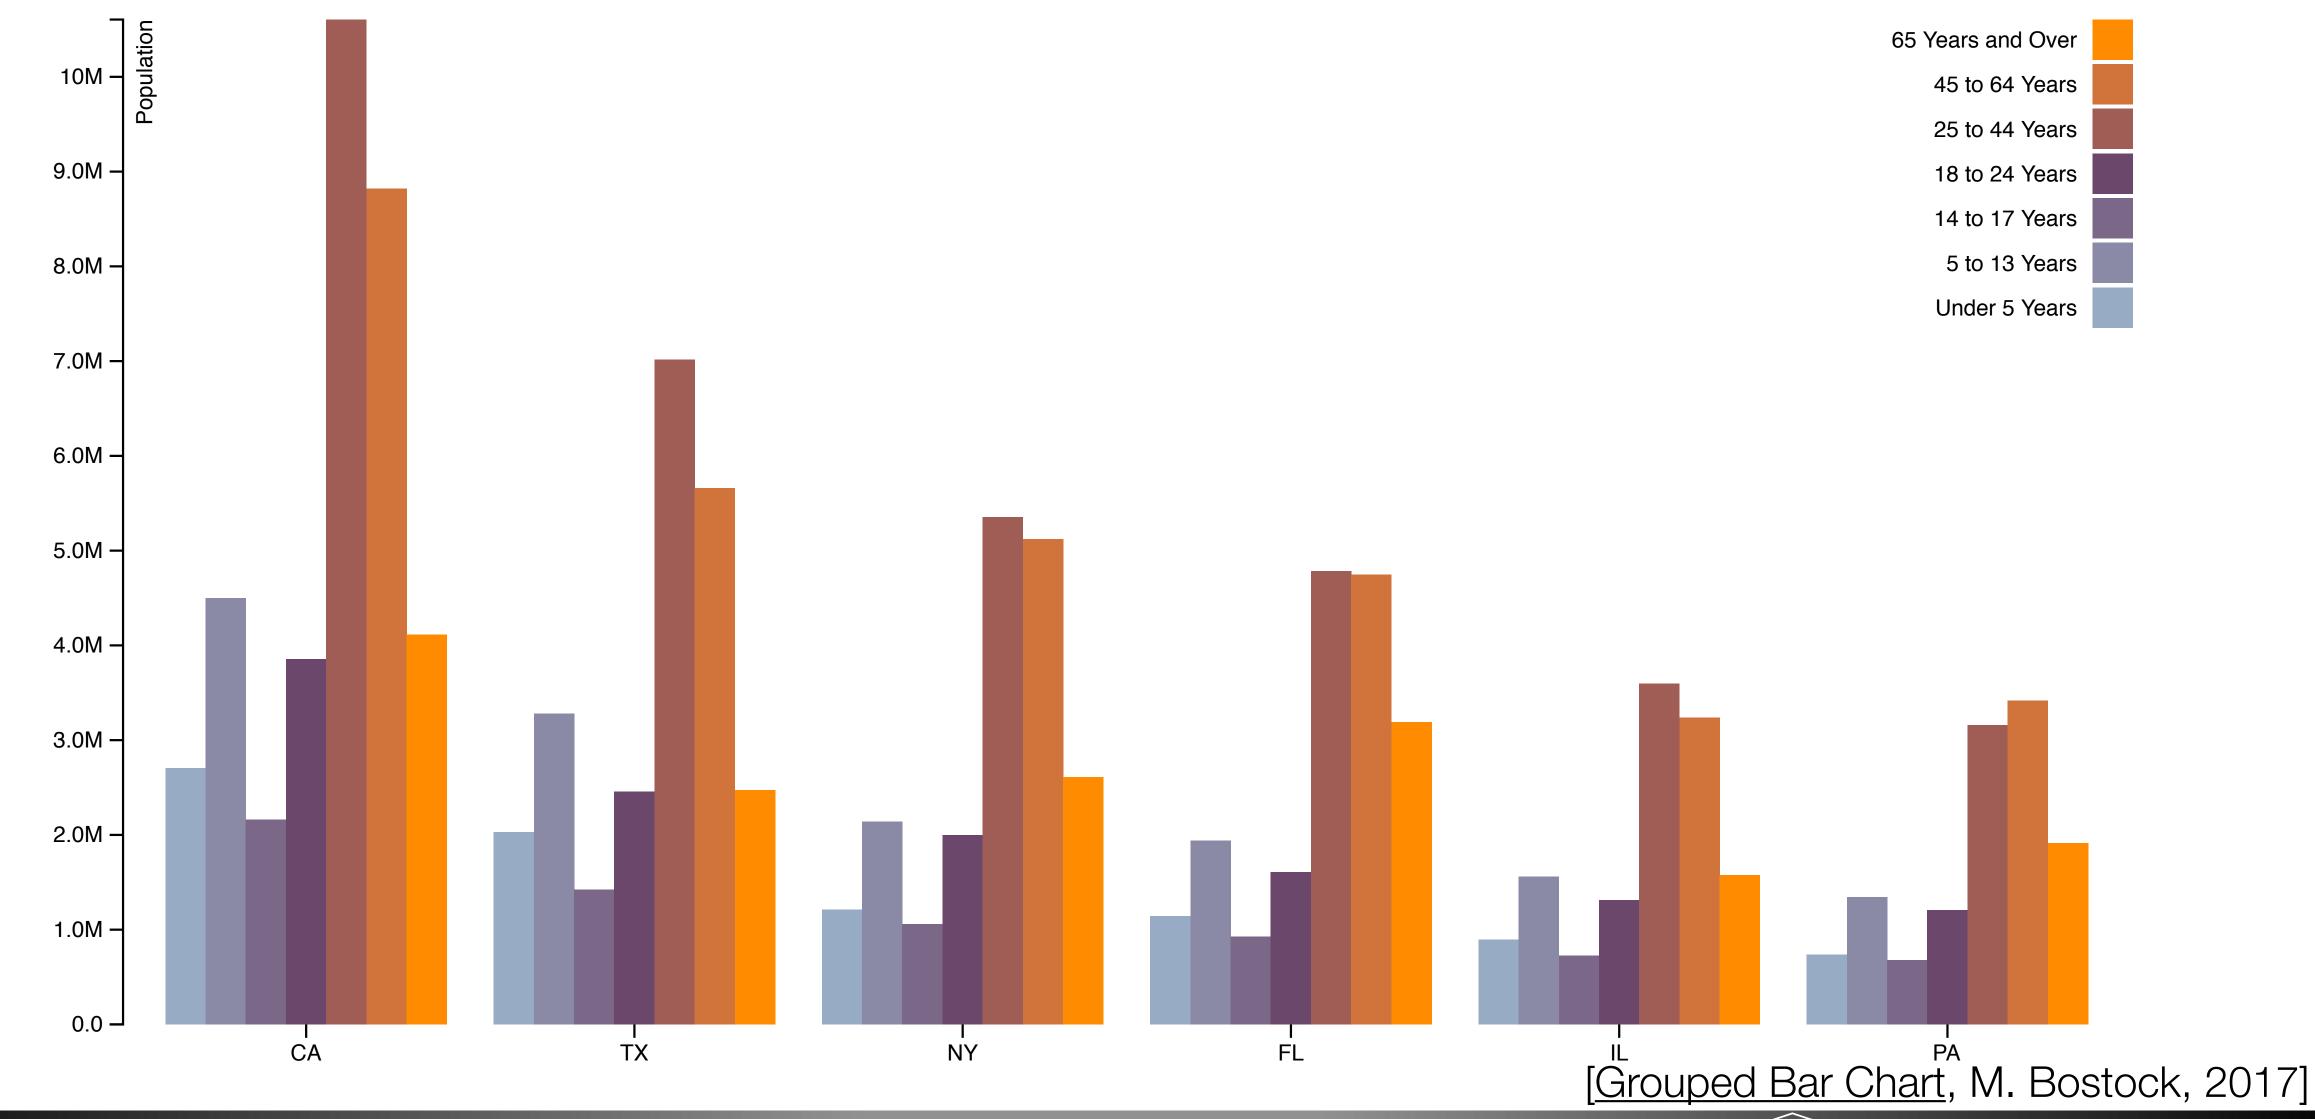

#### Stacked Bar Charts

[Stacked Bar Chart, M. Bostock, 2017]

# Grouped Bar Chart

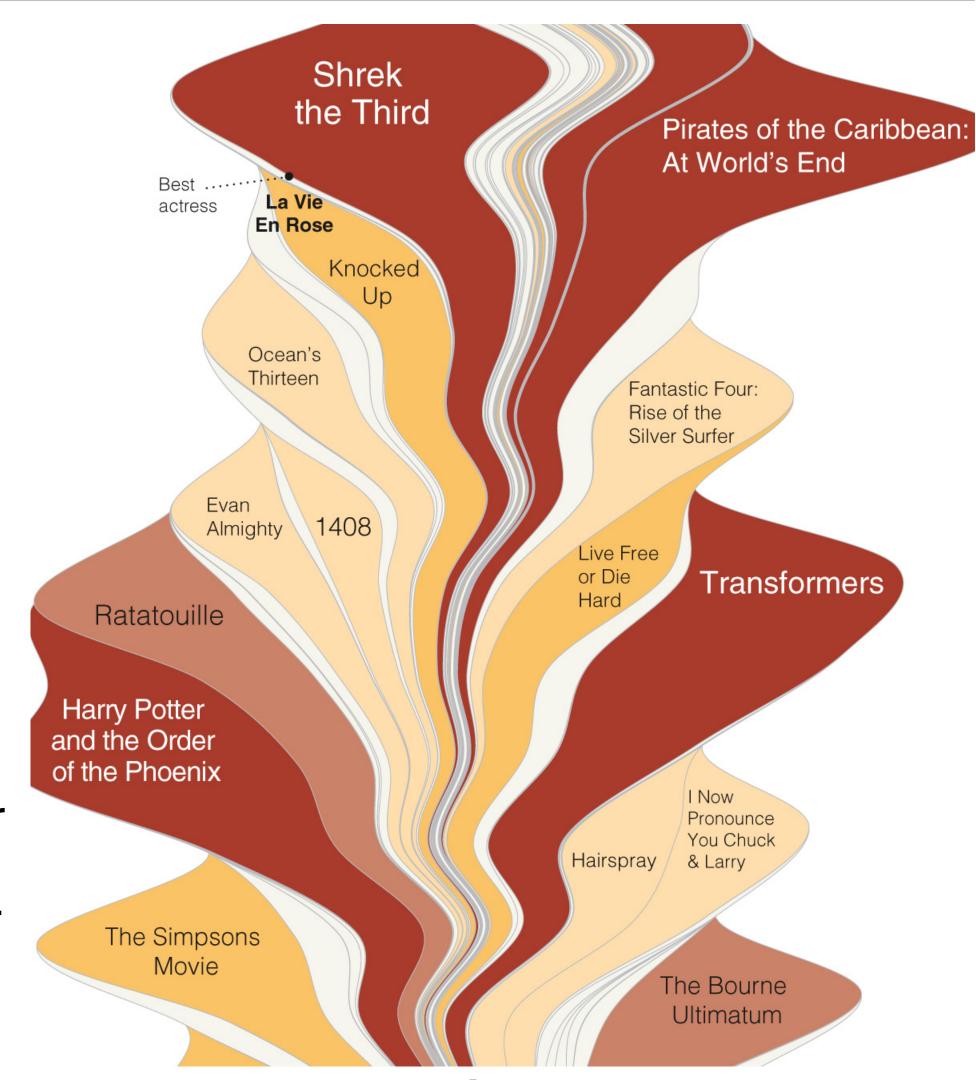

#### Stacked Bar Charts

- Data: multidimensional table: one quantitative, two categorical
- Task: lookup values, part-to-whole relationship, trends
- How: line marks: position (both horizontal & vertical), subcomponent line marks: length, color
- Scalability: main axis (hundreds like bar chart), bar classes (<12)</li>
- Orientation: vertical or horizontal (swap how horizontal and vertical position) are used.

#### Streamgraphs

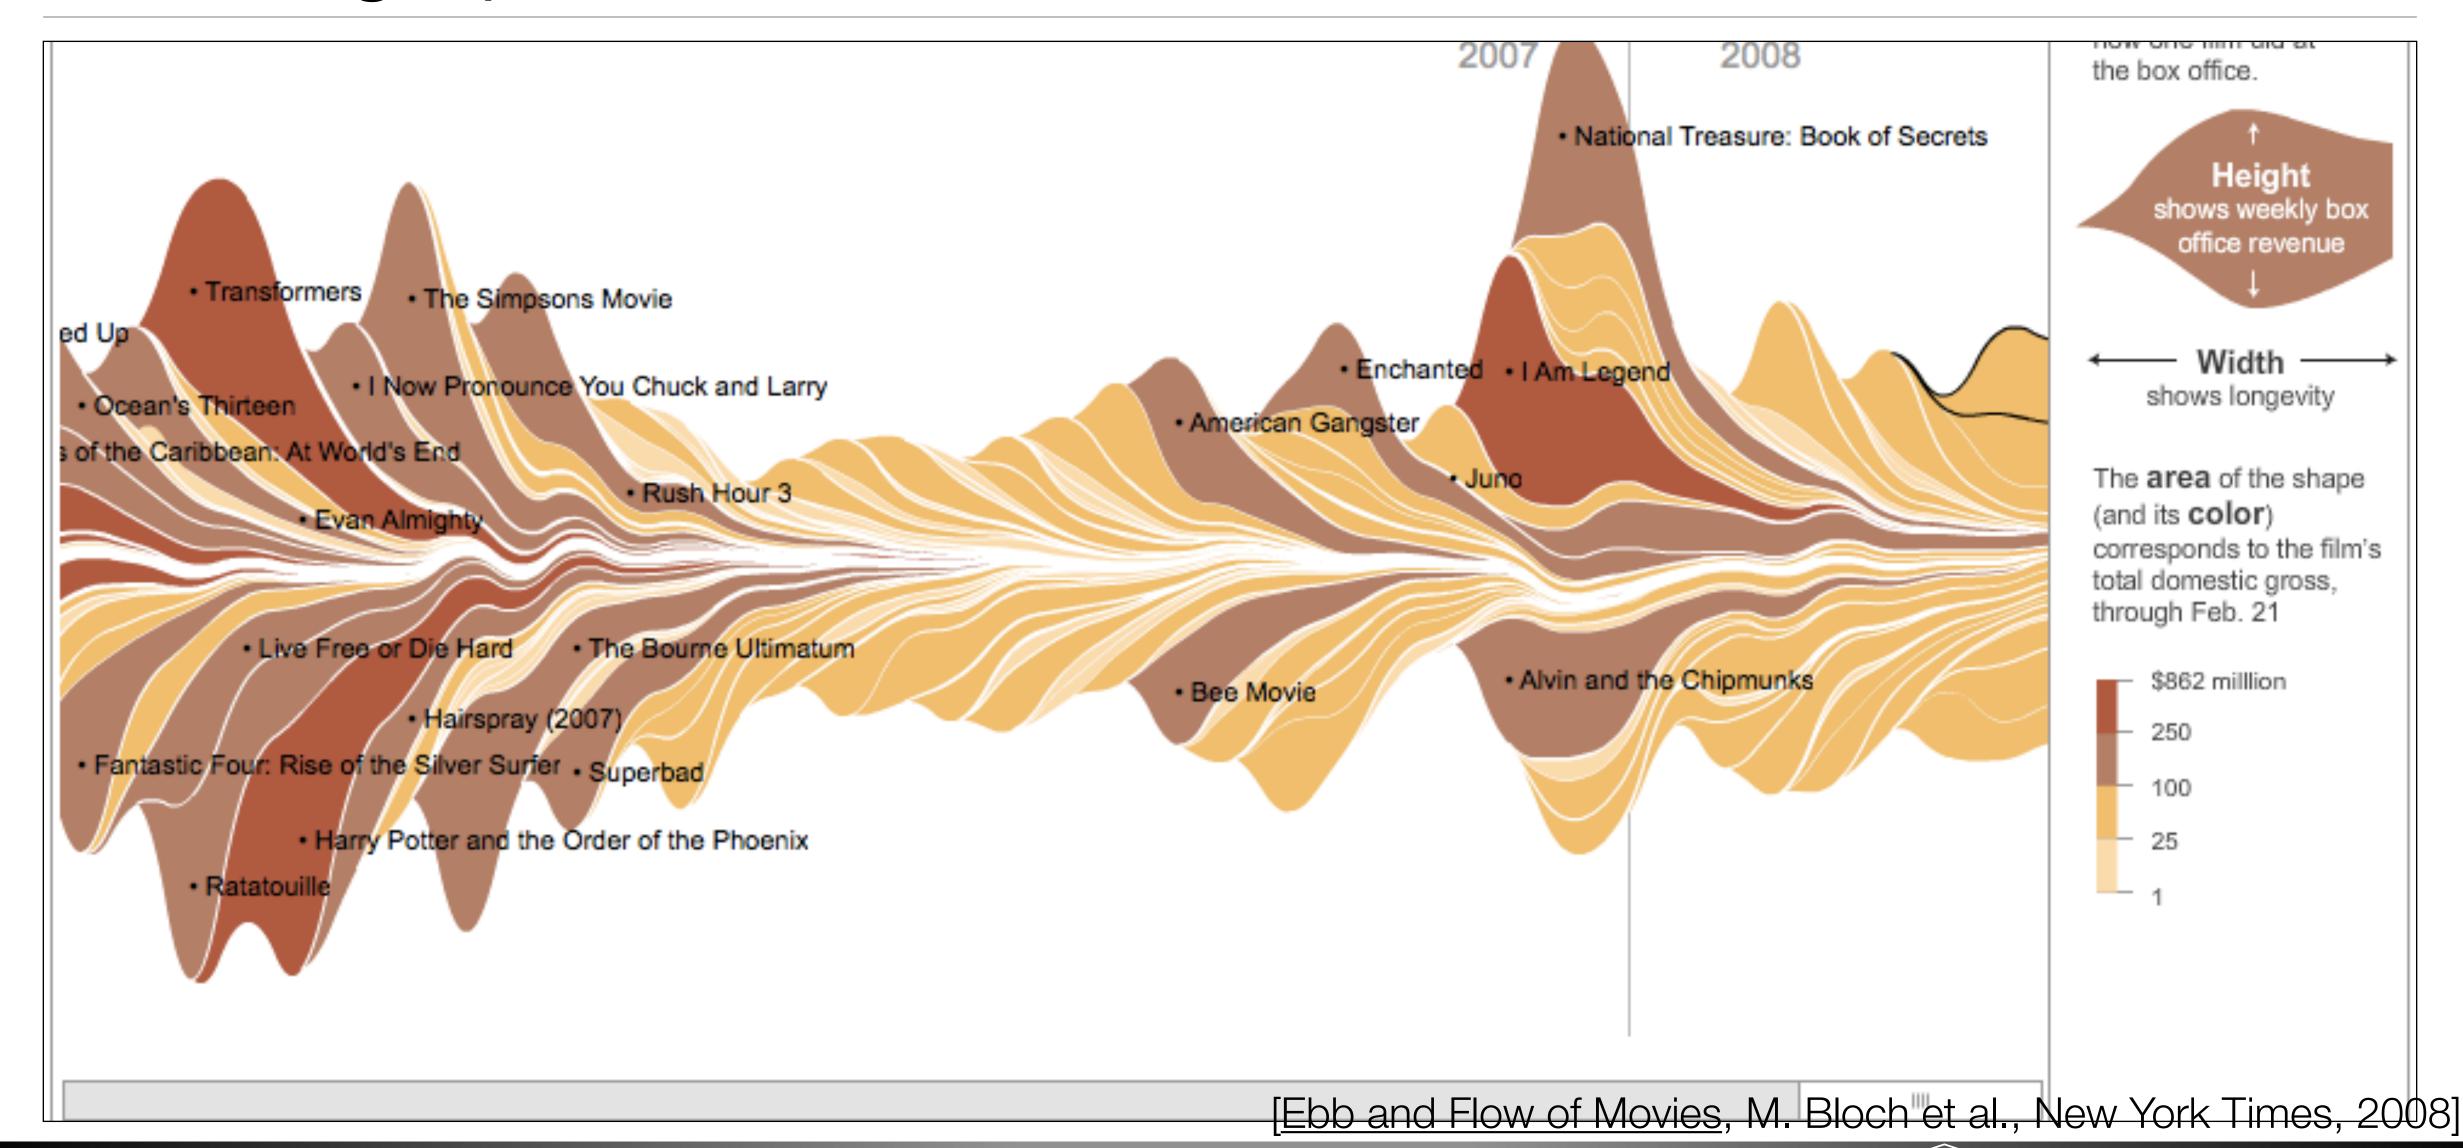

- Include a time attribute
- Data: multidimensional table, one quantitative attribute (count), one ordered key attribute (time), one categorical key attribute
- + derived attribute: layer ordering (quantitative)
- Task: analyze trends in time, find (maxmial) outliers
- How: derived position+geometry, length, color
- Scalability: more categories than stacked bar charts

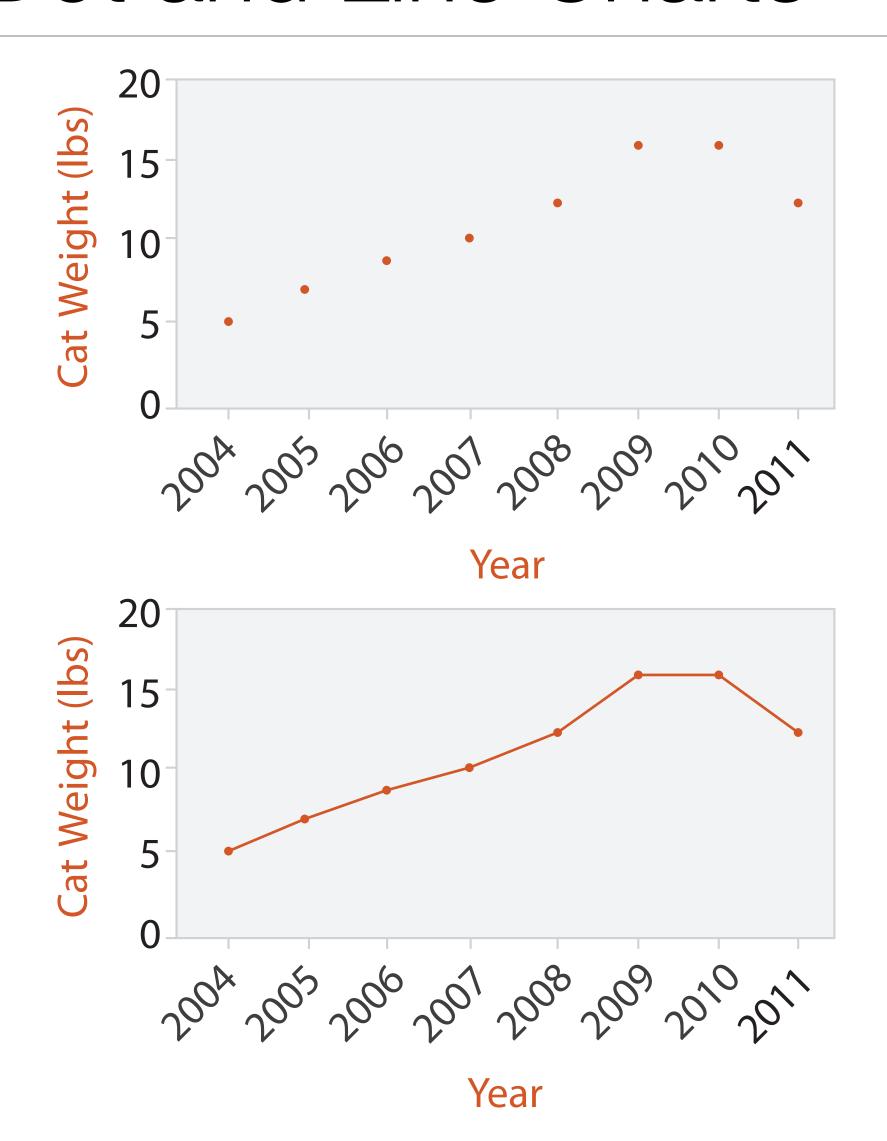

[Byron and Wattenberg, 2012]

### Streamgraphs

#### Dot and Line Charts

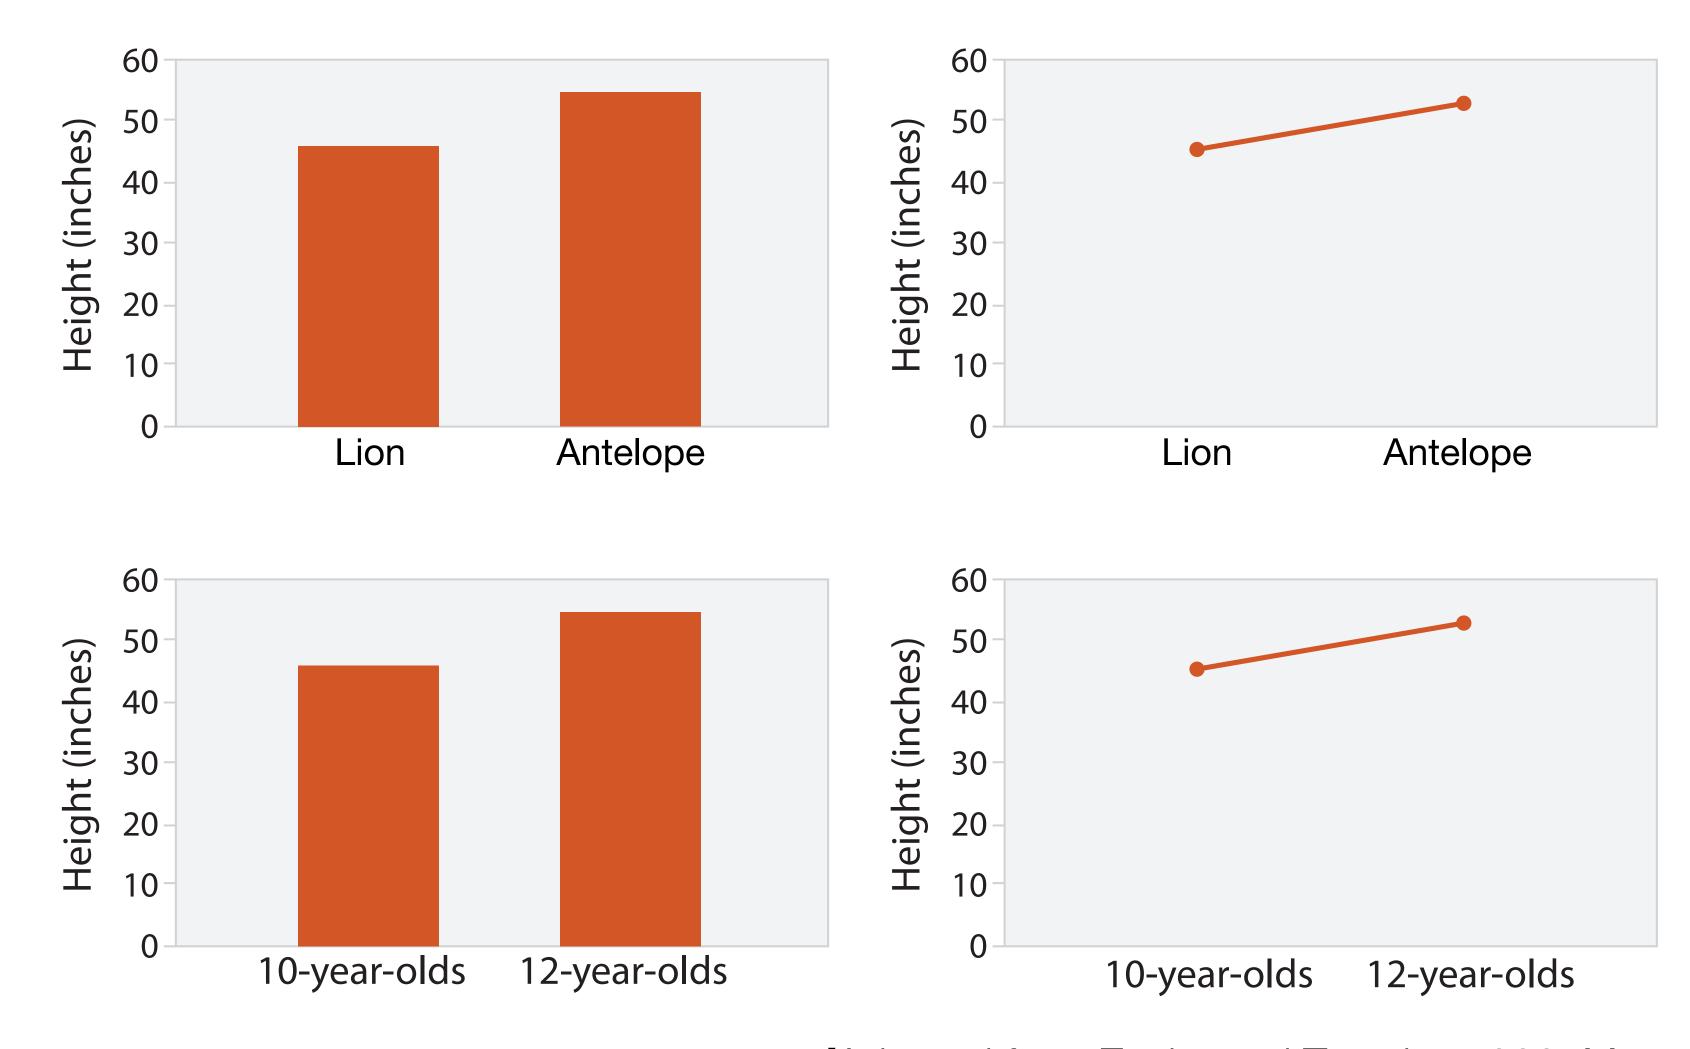

- Data: one quantitative attribute, one ordered attribute
- Task: lookup values, find outliers and trends
- How: point mark and positions
- Line Charts: add connection mark (line)
- Similar to scatterplots but allow ordered attribute

[Munzner (ill. Maguire), 2014]

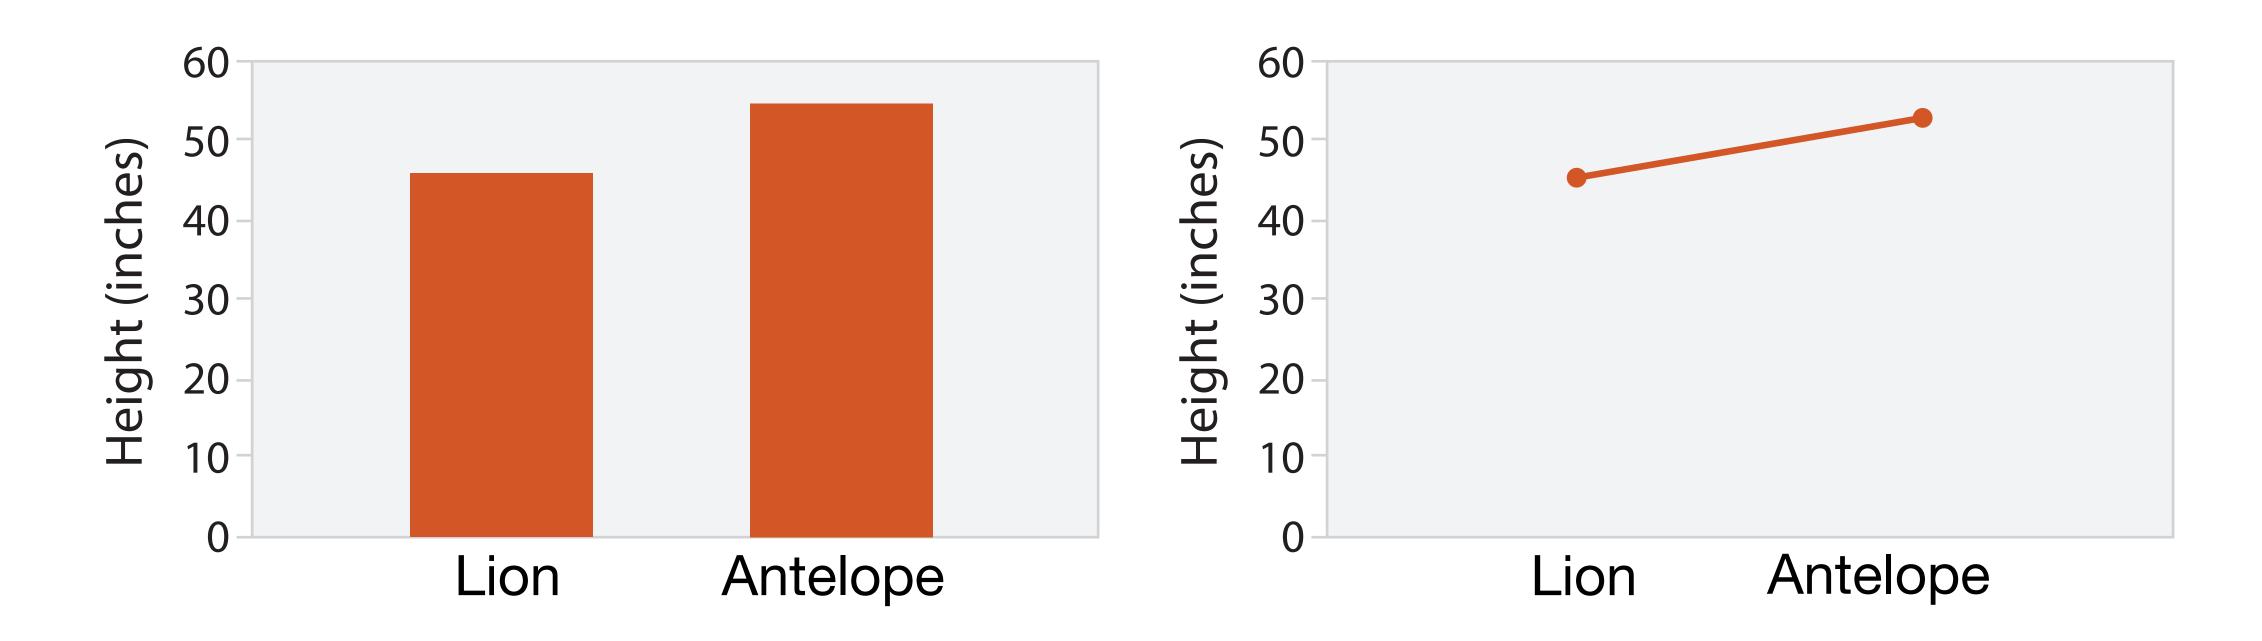

#### Proper Use of Line and Bar Charts

[Adapted from Zacks and Tversky, 1999, Munzner (ill. Maguire), 2014]

#### Proper Use of Line and Bar Charts

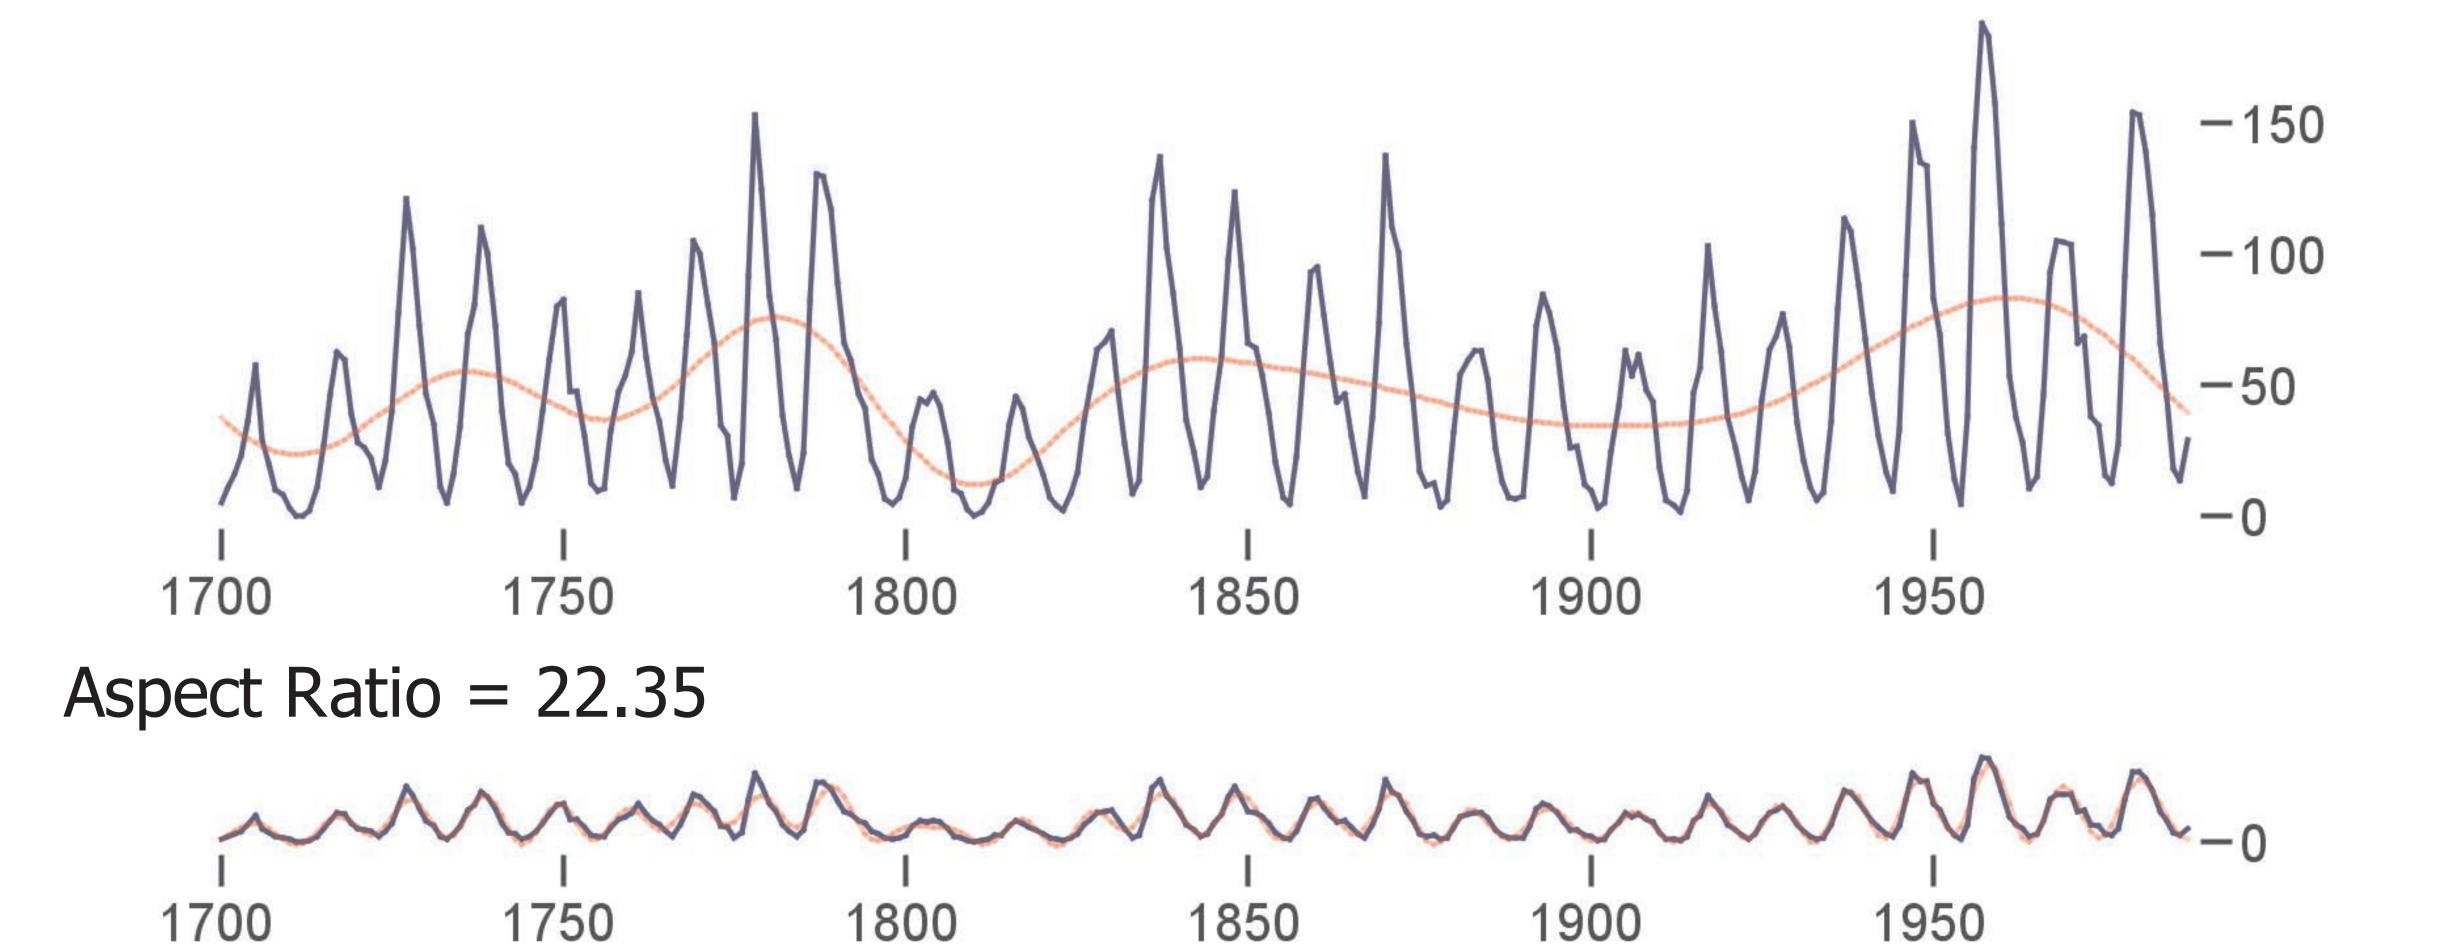

- What does the line indicate?
- Does this make sense?

#### Aspect Ratio

- Trends in line charts are more apparent because we are using angle as a channel
- Perception of angle (and the relative difference between angles) is important
- Initial experiments found people best judge differences in **slope** when angles are around 45 degrees (Cleveland et al., 1988, 1993)

#### Multiscale Banking

Aspect Ratio = 3.96

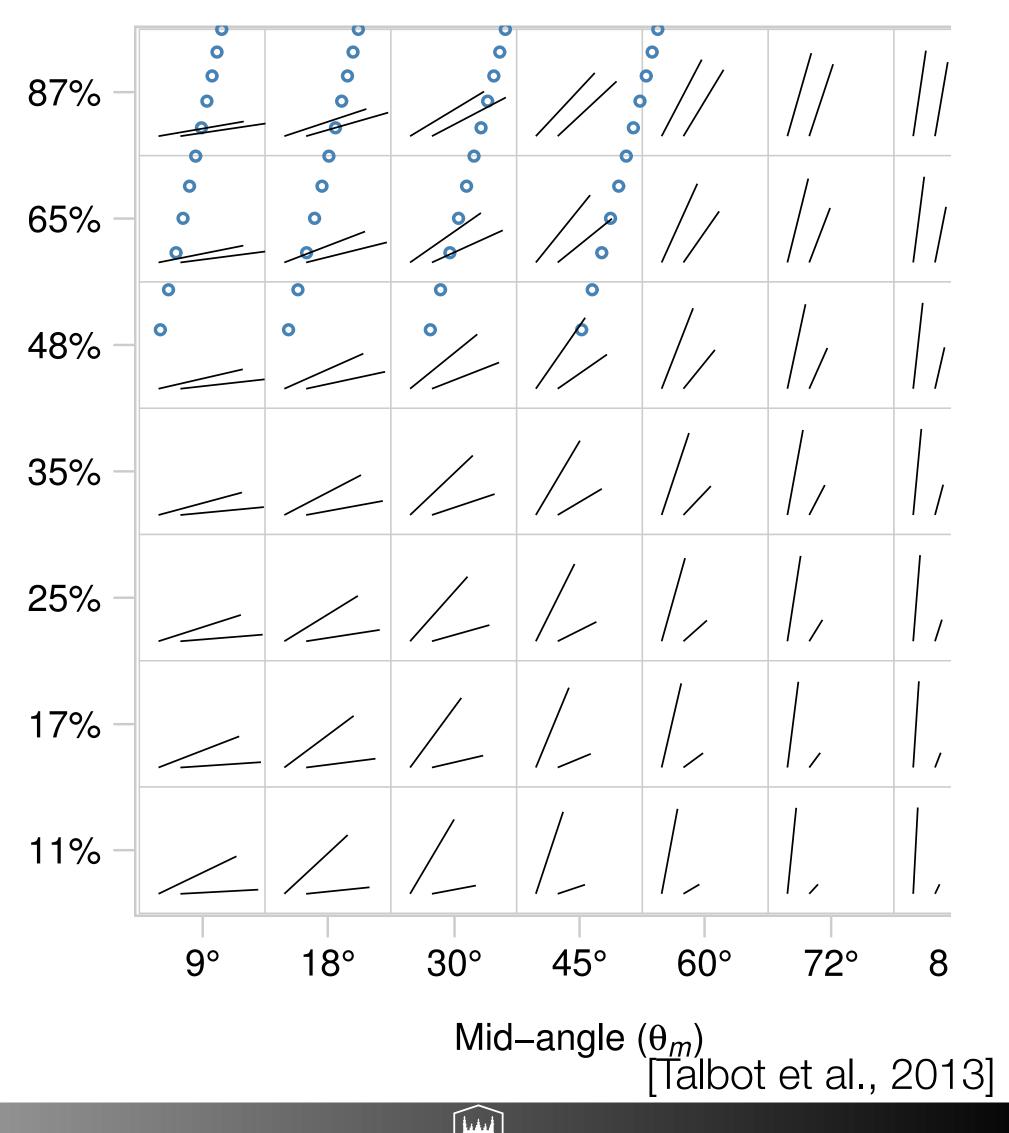

#### Multiscale Banking

Aspect Ratio = 4.23-101998-12-10 2000-04-13 2001-08-16 2002-12-24 2004-04-29 1997-08-08 Aspect Ratio = 14.55 1997-08-08 1998-12-10 2000-04-13 2001-08-16 2002-12-24 2004-04-29 2005-08-31 [Heer and Agrawala, 2006]

### Expanding the Study

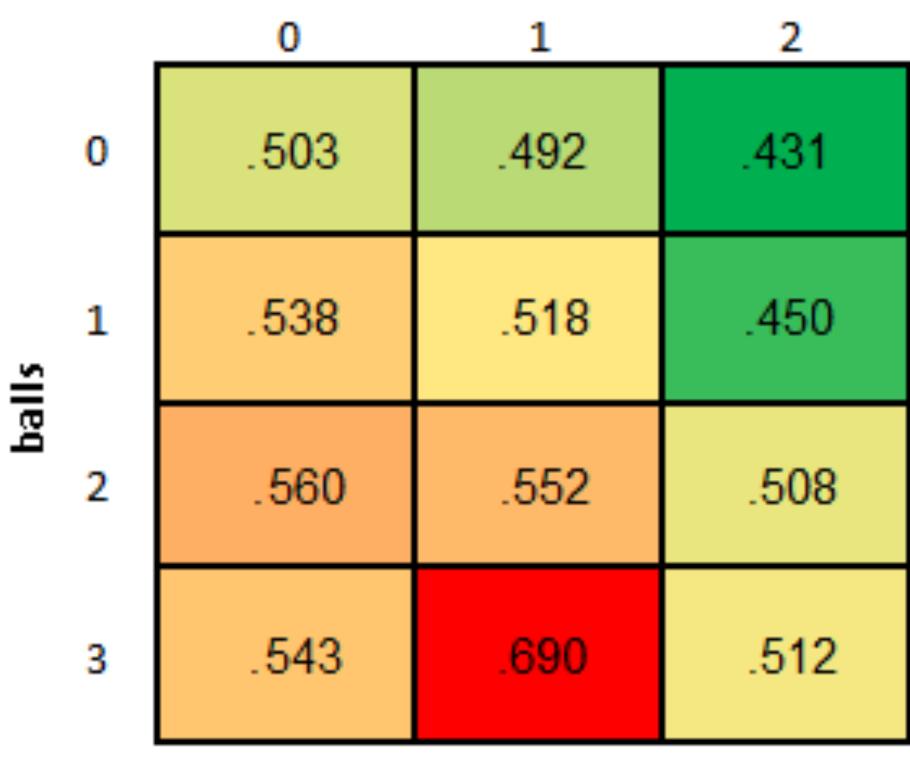

- Cleveland et al. did not study the entire space of slope comparisons and 45 degrees was at the low end of their study (blue marks on right)
- Talbot et al. compared more slopes and found that people do better with smaller slopes
- Baselines may aid with this

#### Heatmaps

- Data: Two keys, one quantitative attribute
- Task: Find clusters, outliers, summarize
- How: area marks in grid, color encoding of quantitative attribute
- Scalability: number of pixels for area marks (millions), <12 colors</li>
- Red-green color scales often used
  - Be aware of colorblindness!

[fastpitchanalytics.com]

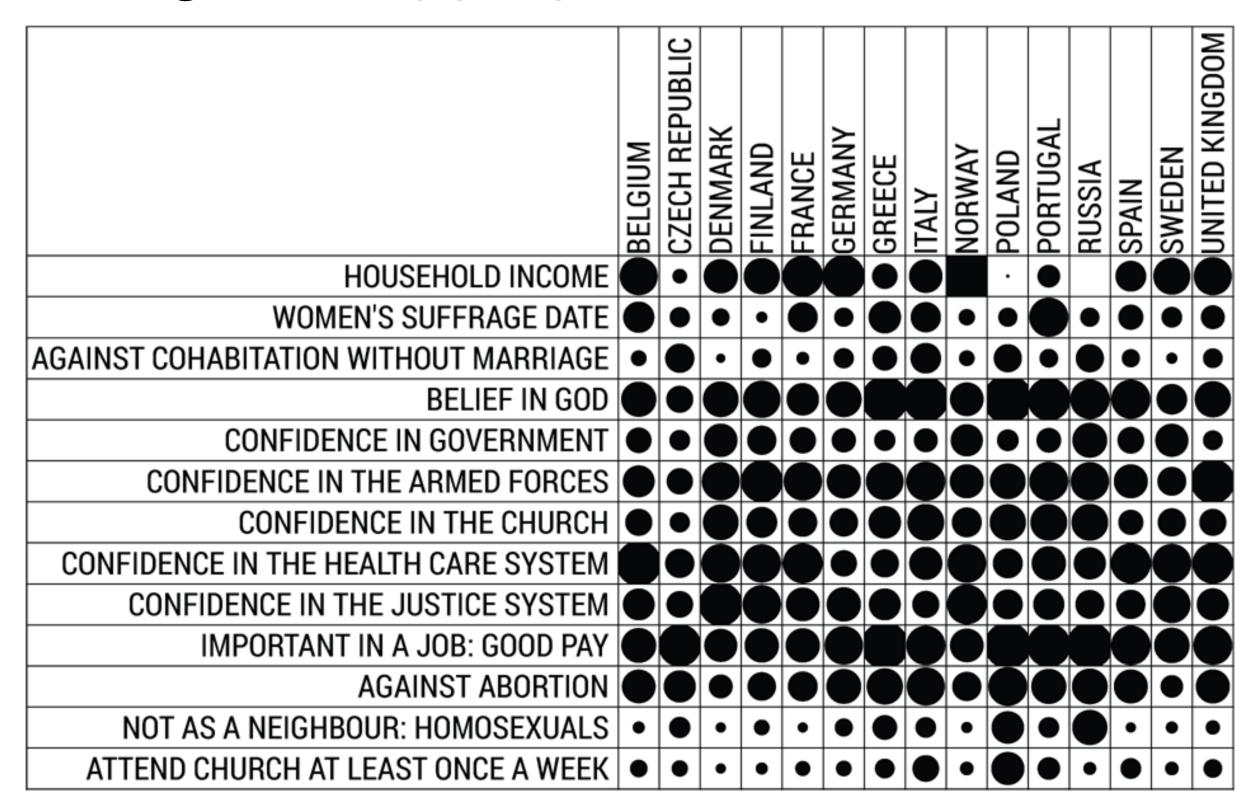

#### Bertin Matrices

- Must we only use color?
  - What other marks might be appropriate?

[C.Perrin et al., 2014]

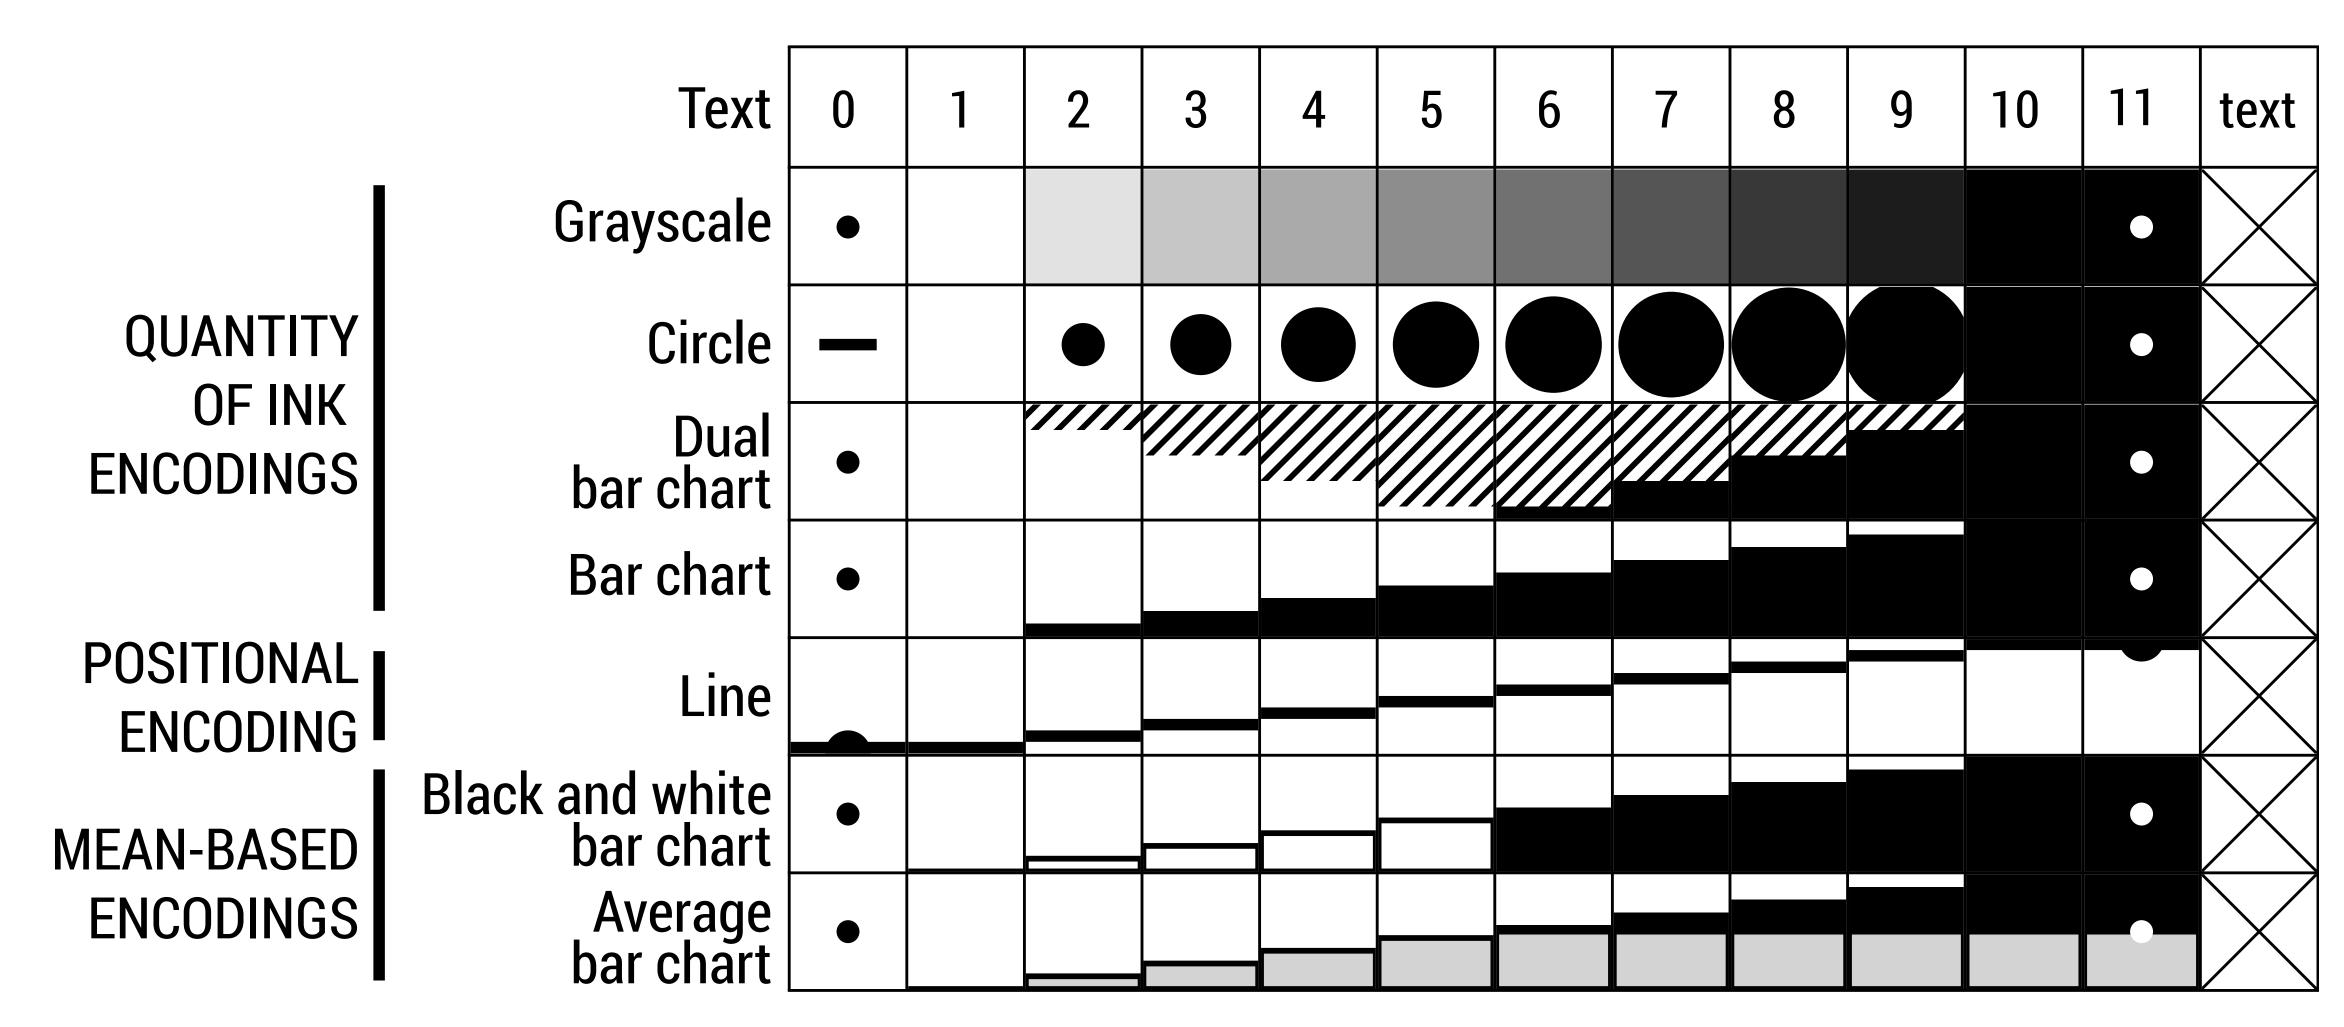

#### Bertin Matrices

- Must we only use color?
  - What other marks might be appropriate?

[C.Perrin et al., 2014]

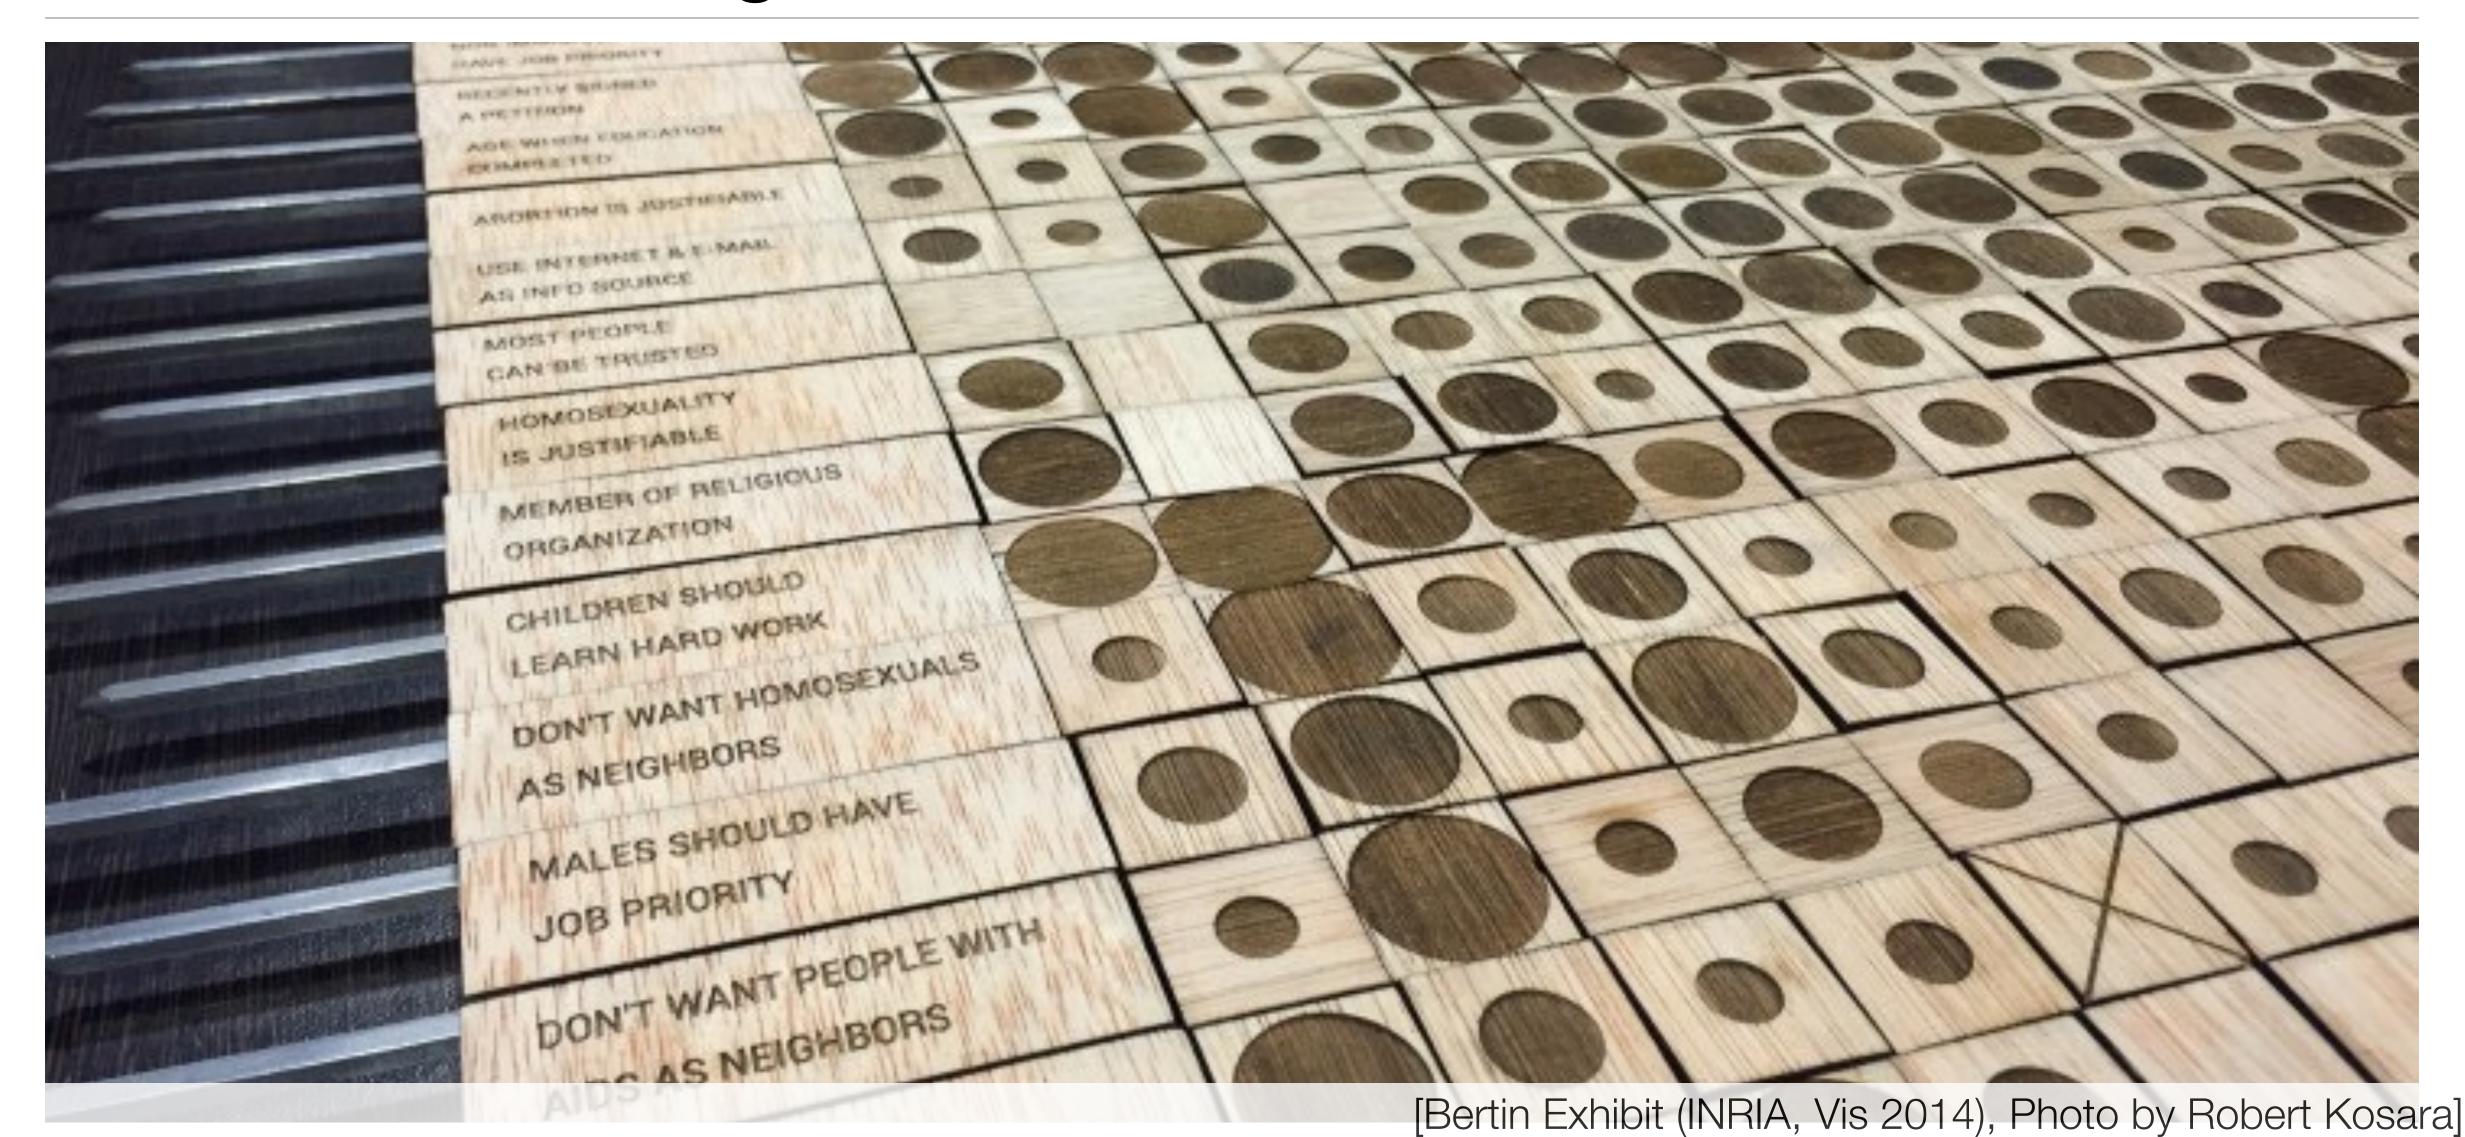

#### Bertin's Encodings

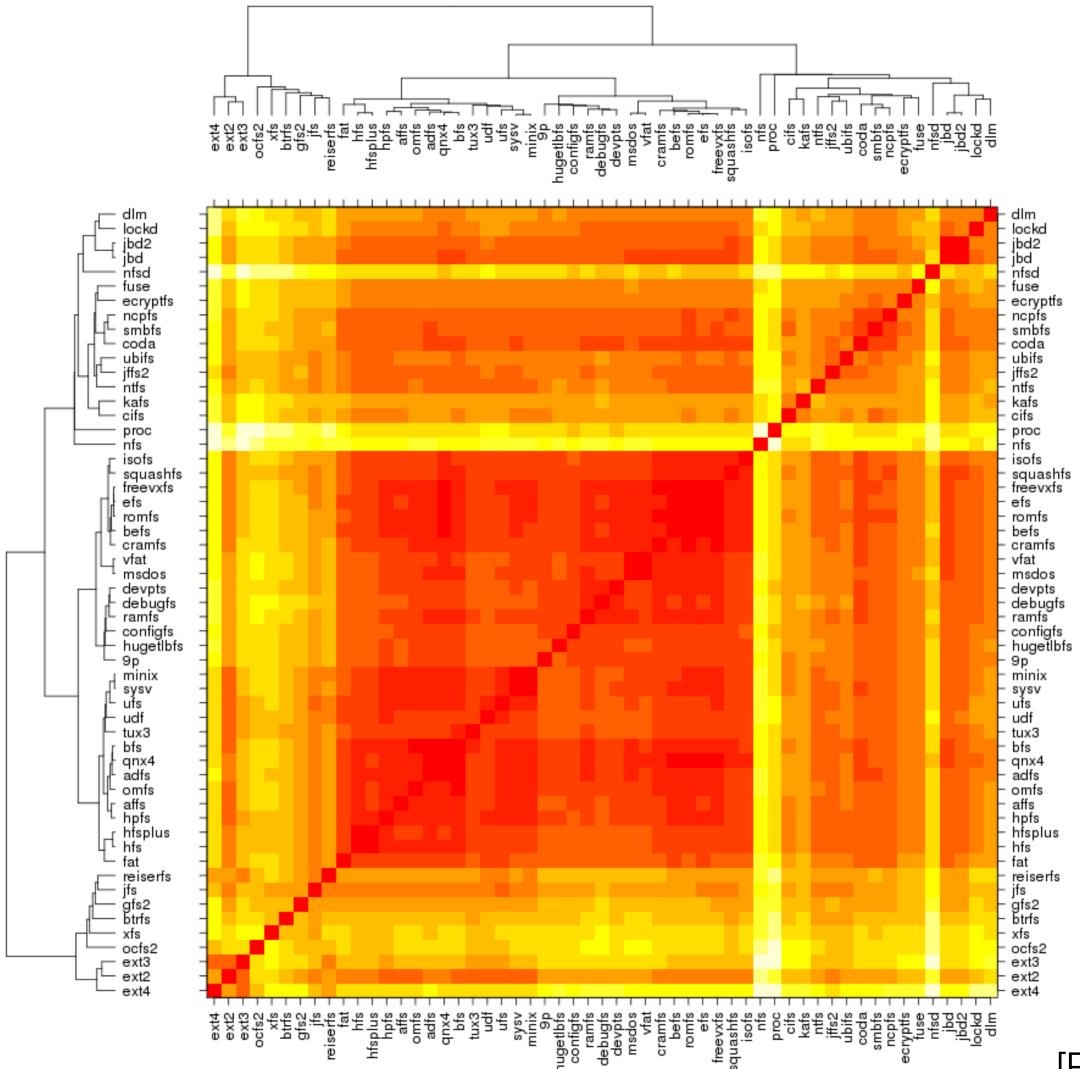

[C.Perrin et al., 2014]

### Matrix Reordering

# Cluster Heatmap

[File System Similarity, R. Musăloiu-E., 2009]

#### Cluster Heatmap

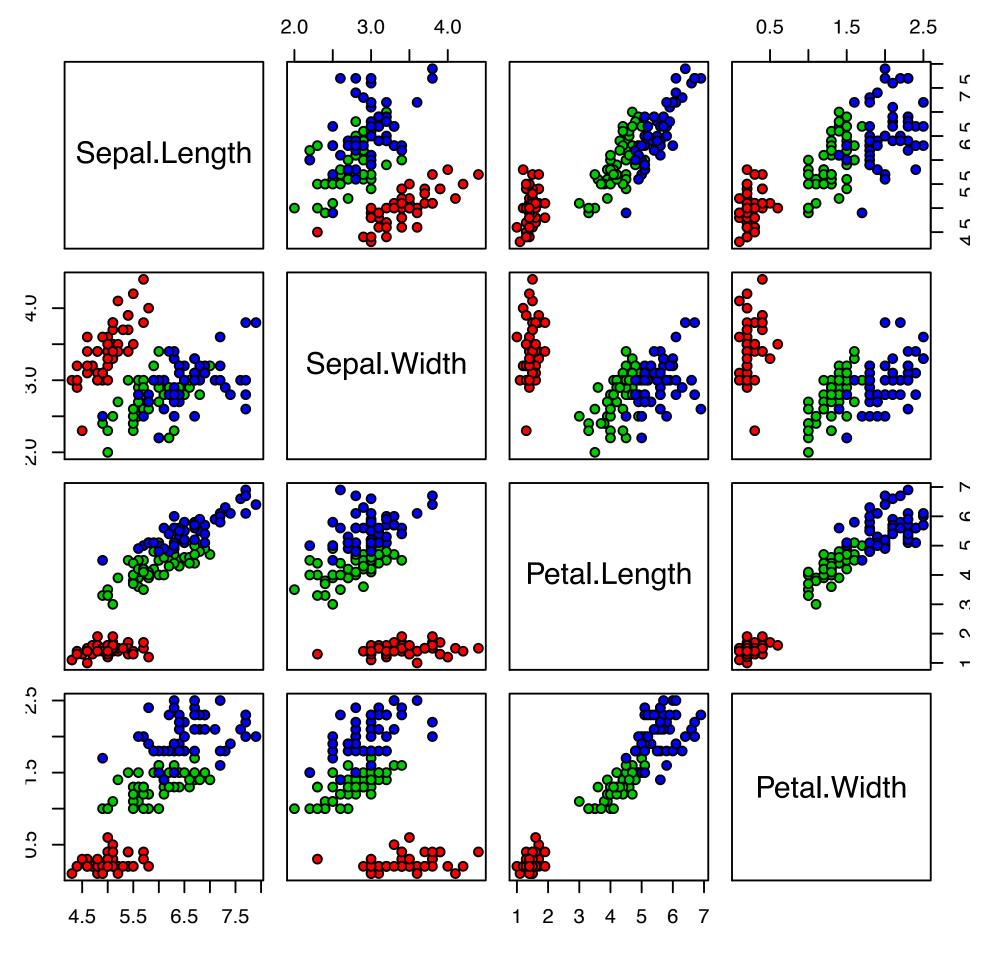

- Data & Task: Same as Heatmap
- How: Area marks but matrix is ordered by cluster hierarchies
- Scalability: limited by the cluster dendrogram
- Dendrogram: a visual encoding of tree data with leaves aligned

# Scatterplot Matrix (SPLOM)

- Data: Many quantitative attributes
- Derived Data: names of attributes
- Task: Find correlations, trends, outliers
- How: Scatterplots in matrix alignment
- Scale: attributes: ~12, items: hundreds?

 Visualizations in a visualization: at high level, marks are themselves visualizations...

#### Iris Data (red=setosa,green=versicolor,blue=virginica)

[Wikipedia]

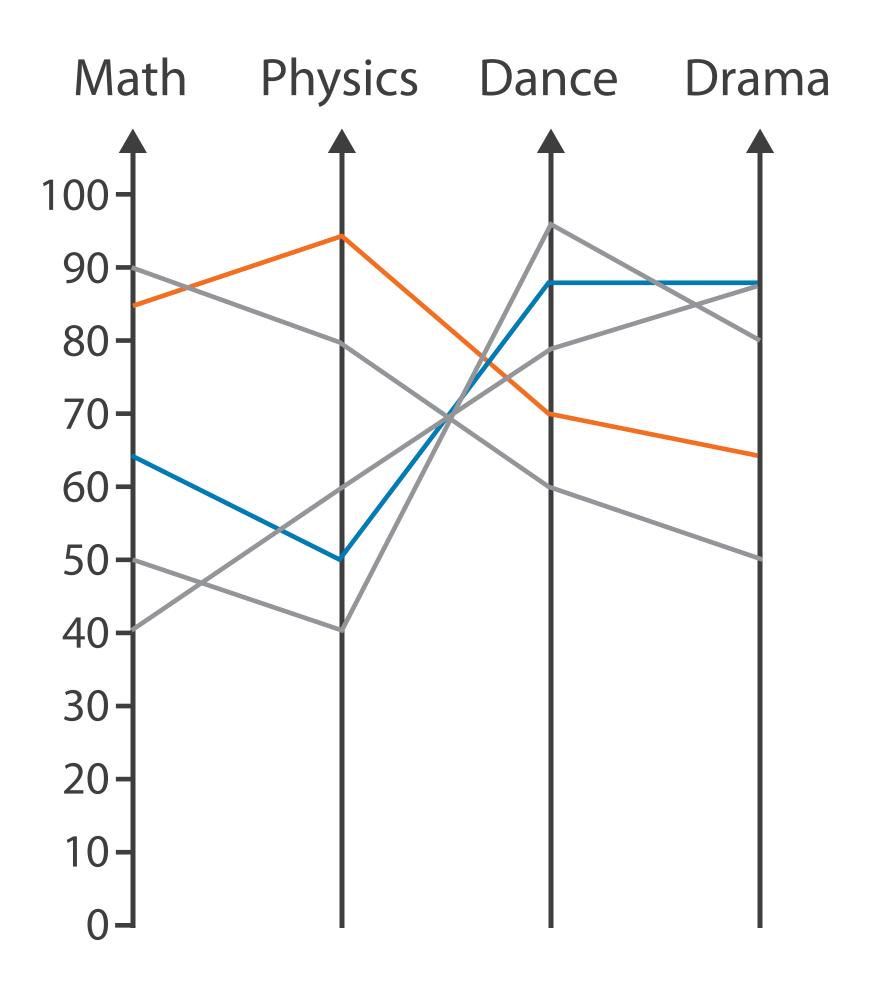

### Spatial Axis Orientation

- So far, we have seen the vertical and horizontal axes (a rectilinear layout) used to encode almost everything
- What other possibilities are there for axes?

## Spatial Axis Orientation

- So far, we have seen the vertical and horizontal axes (a rectilinear layout) used to encode almost everything
- What other possibilities are there for axes?
  - Parallel axes

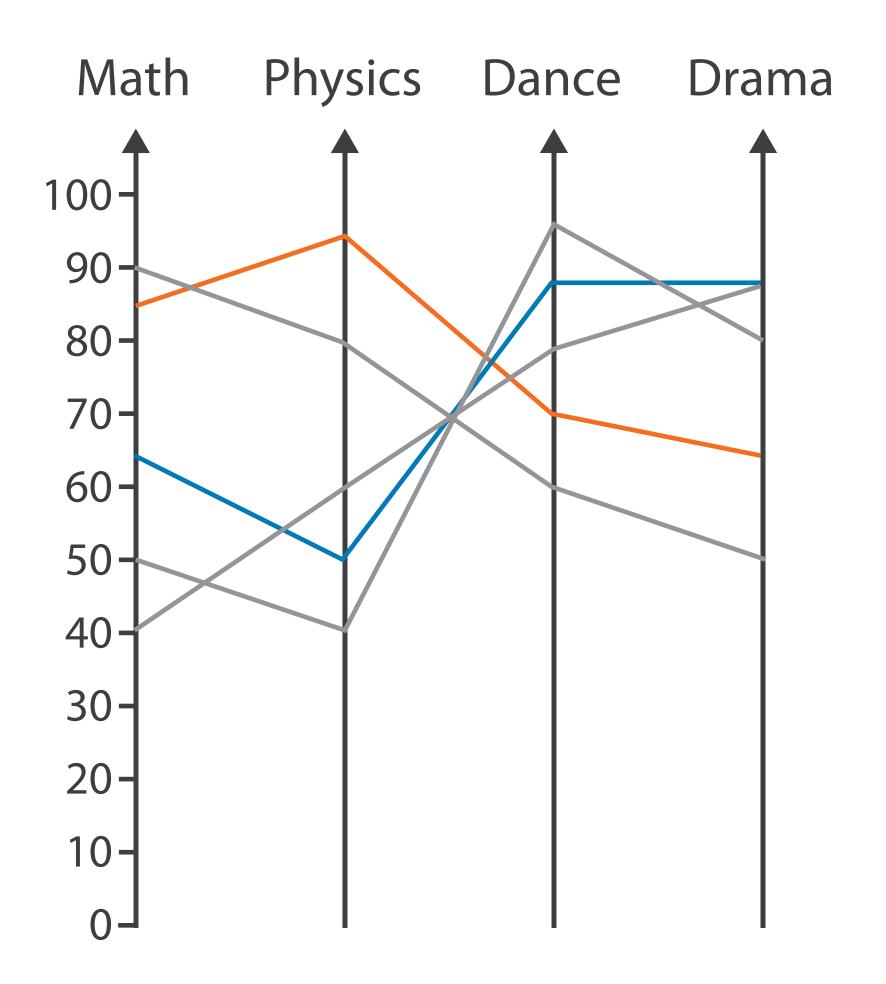

[Munzner (ill. Maguire), 2014]

## Spatial Axis Orientation

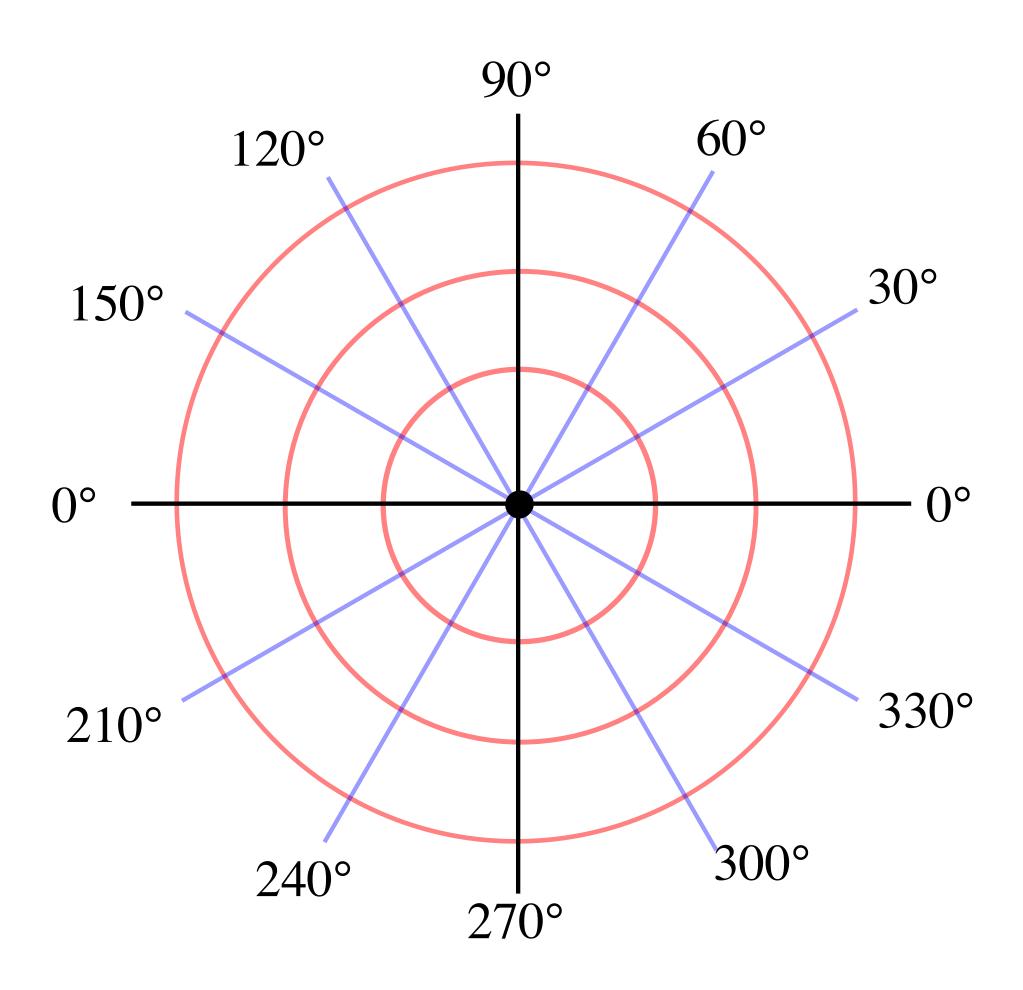

- So far, we have seen the vertical and horizontal axes (a rectilinear layout) used to encode almost everything
- What other possibilities are there for axes?
  - Parallel axes
  - Radial axes

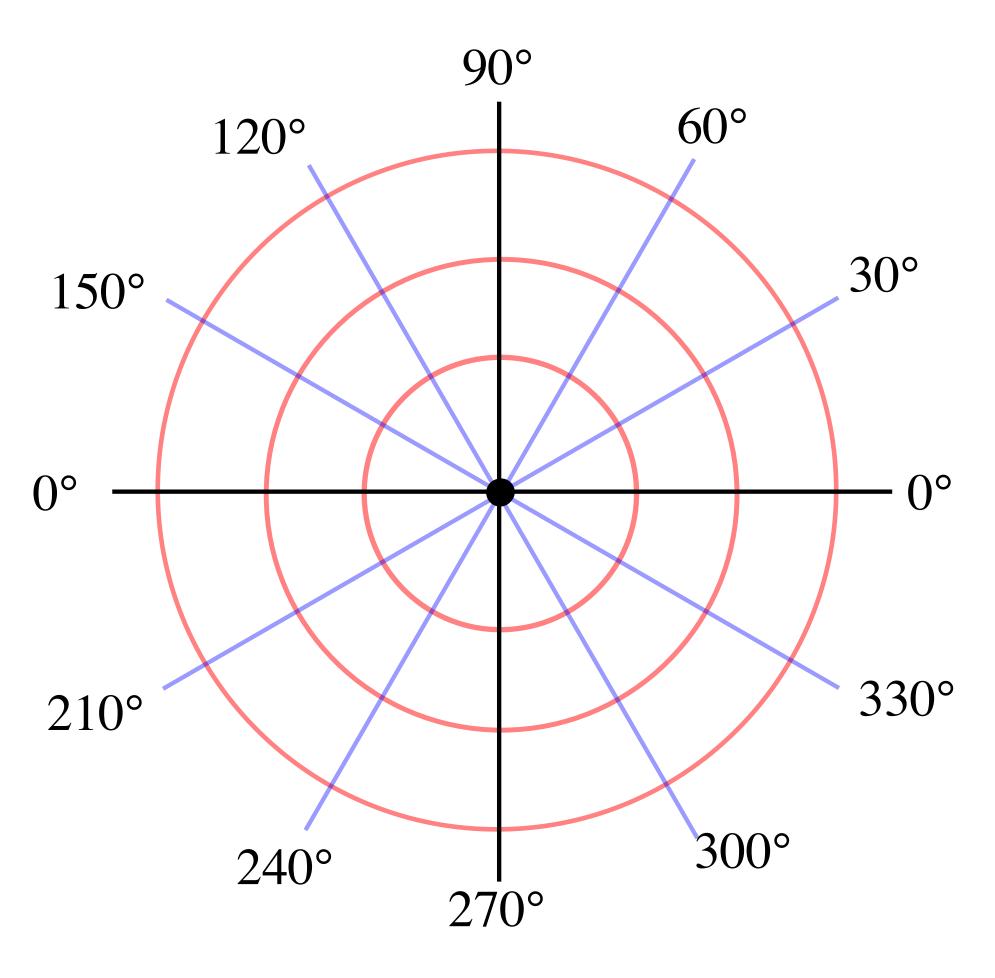

[Munzner (ill. Maguire), 2014]

### Radial Axes

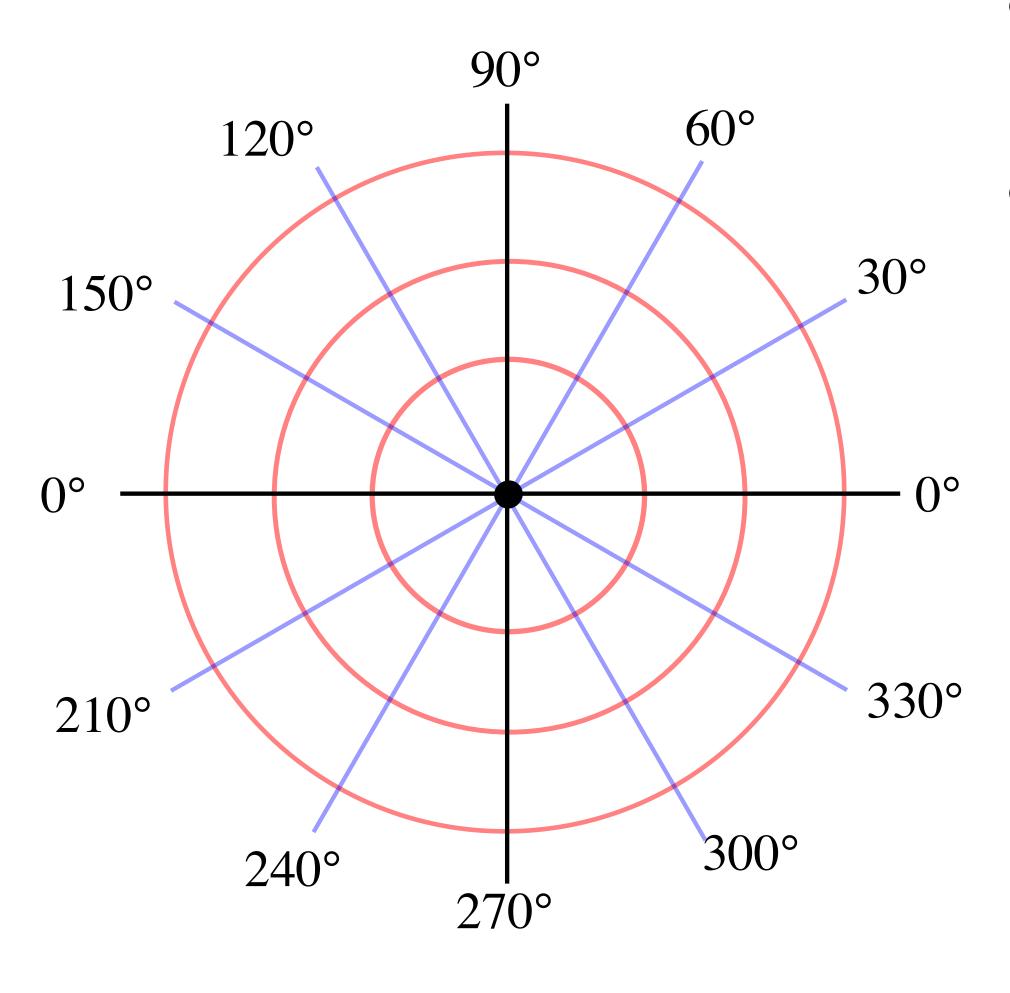

#### Radial Axes

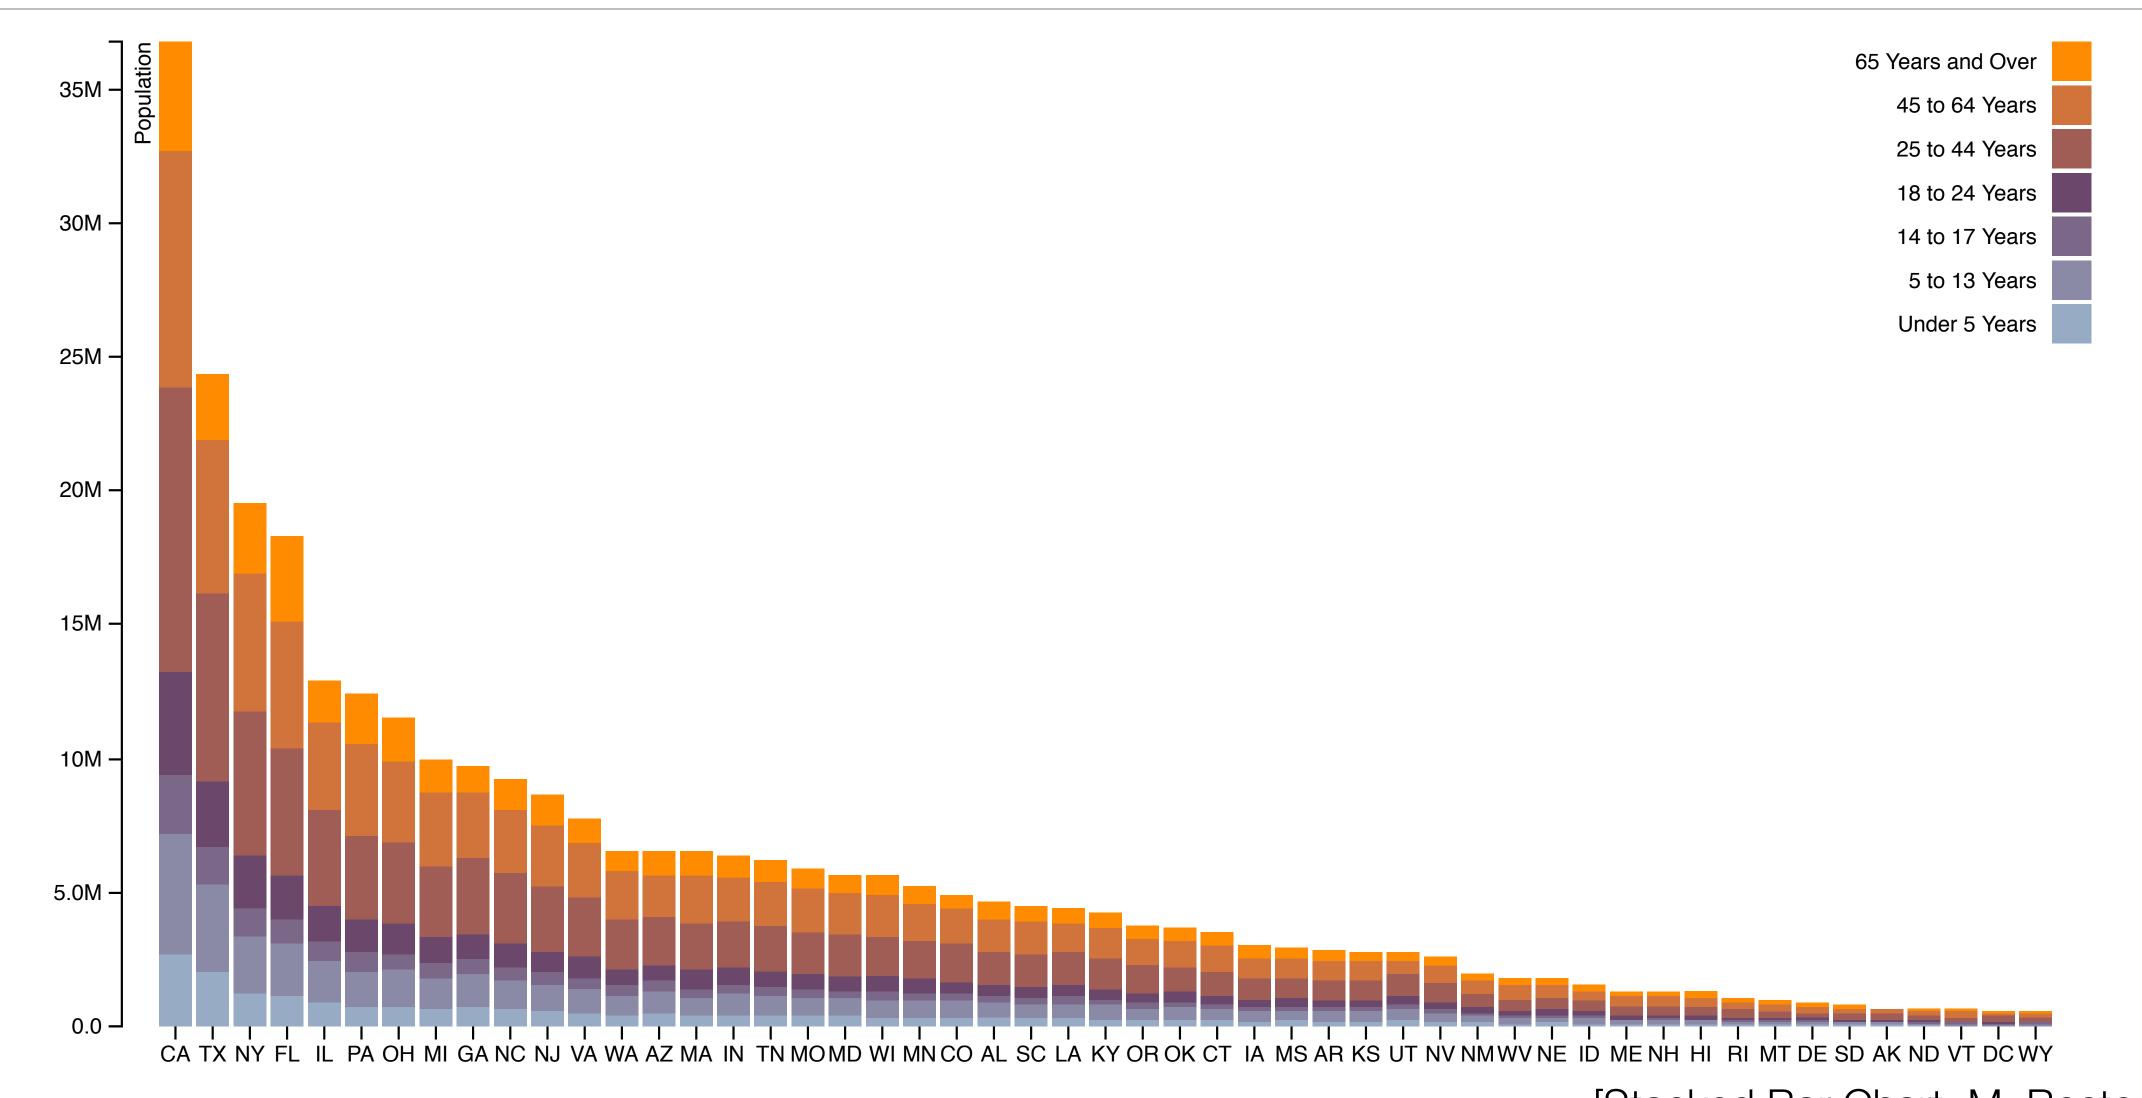

- Polar Coordinates (angle + position along the line at that angle)
- What types of encodings are possible for tabular data in polar coordinates?

#### Radial Axes

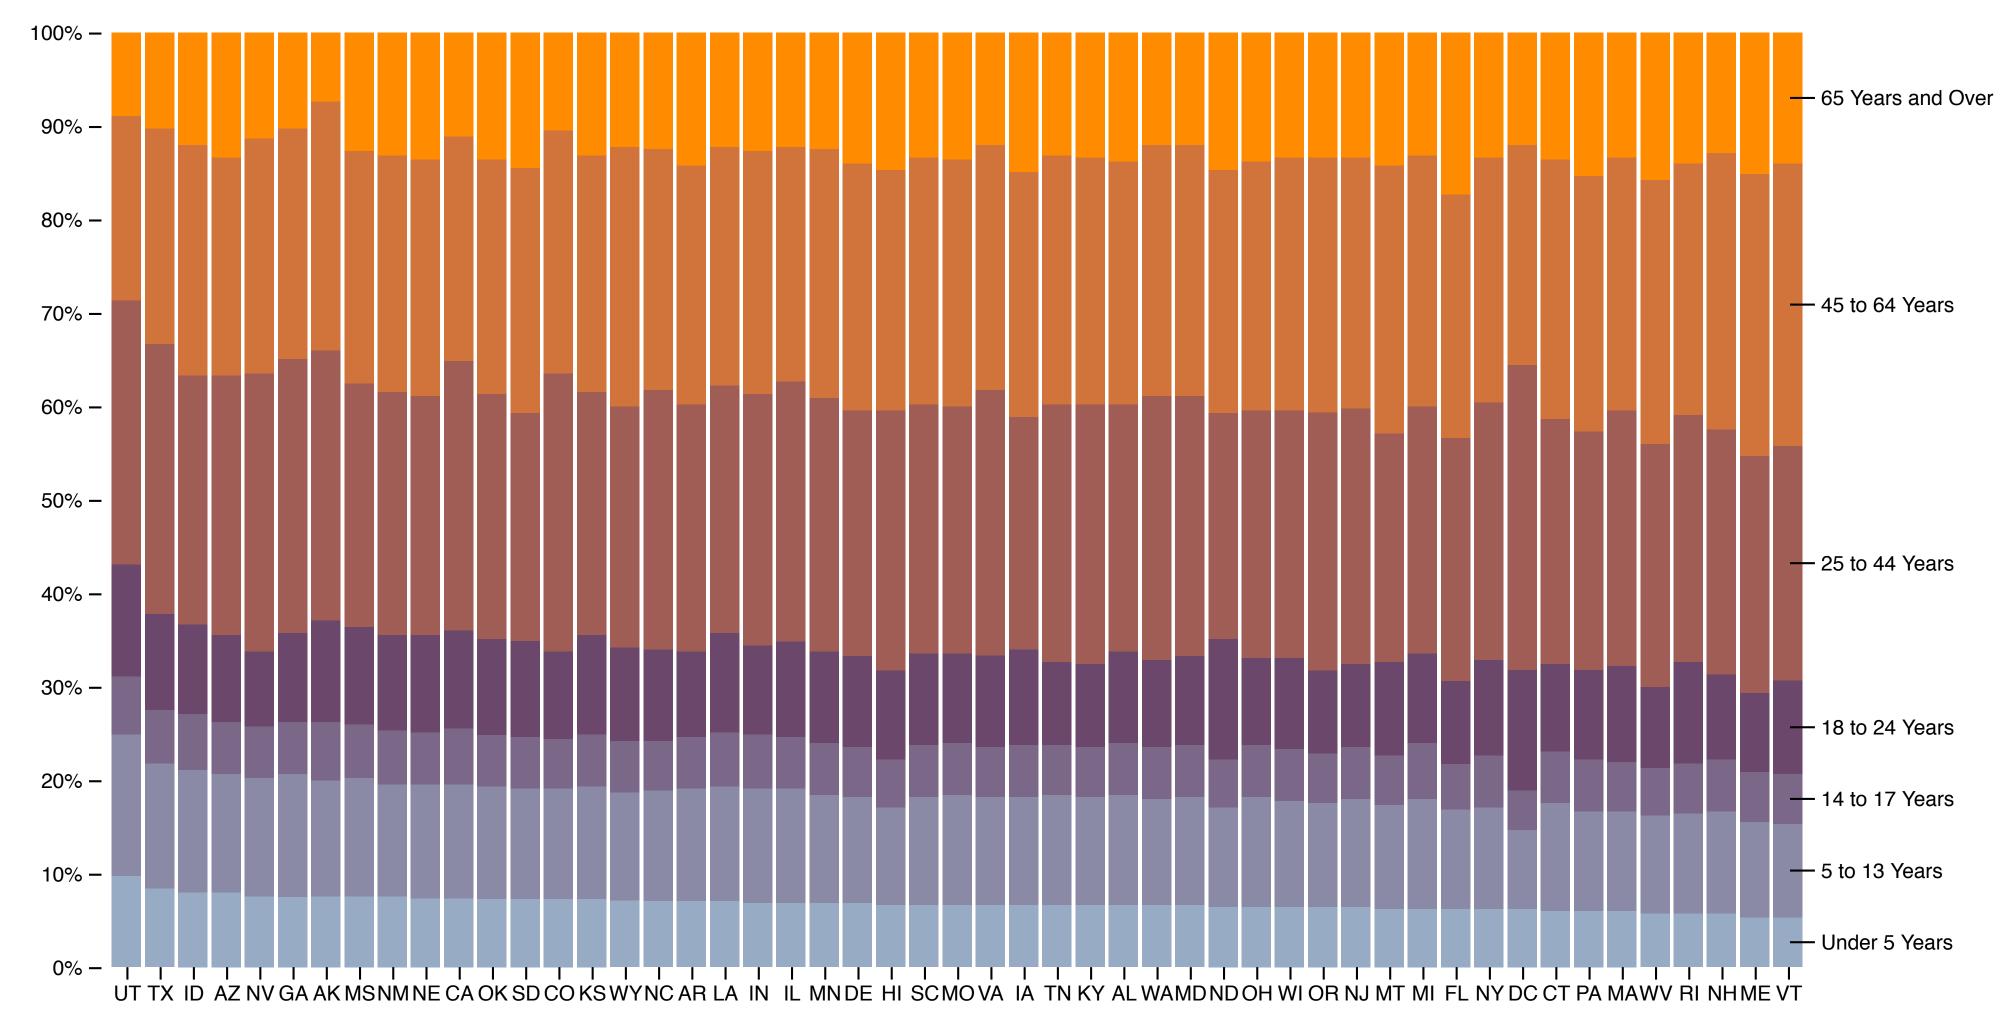

- Polar Coordinates (angle + position along the line at that angle)
- What types of encodings are possible for tabular data in polar coordinates?
  - Radial bar charts
  - Pie charts
  - Donut charts

## Part-of-whole: Relative % comparison?

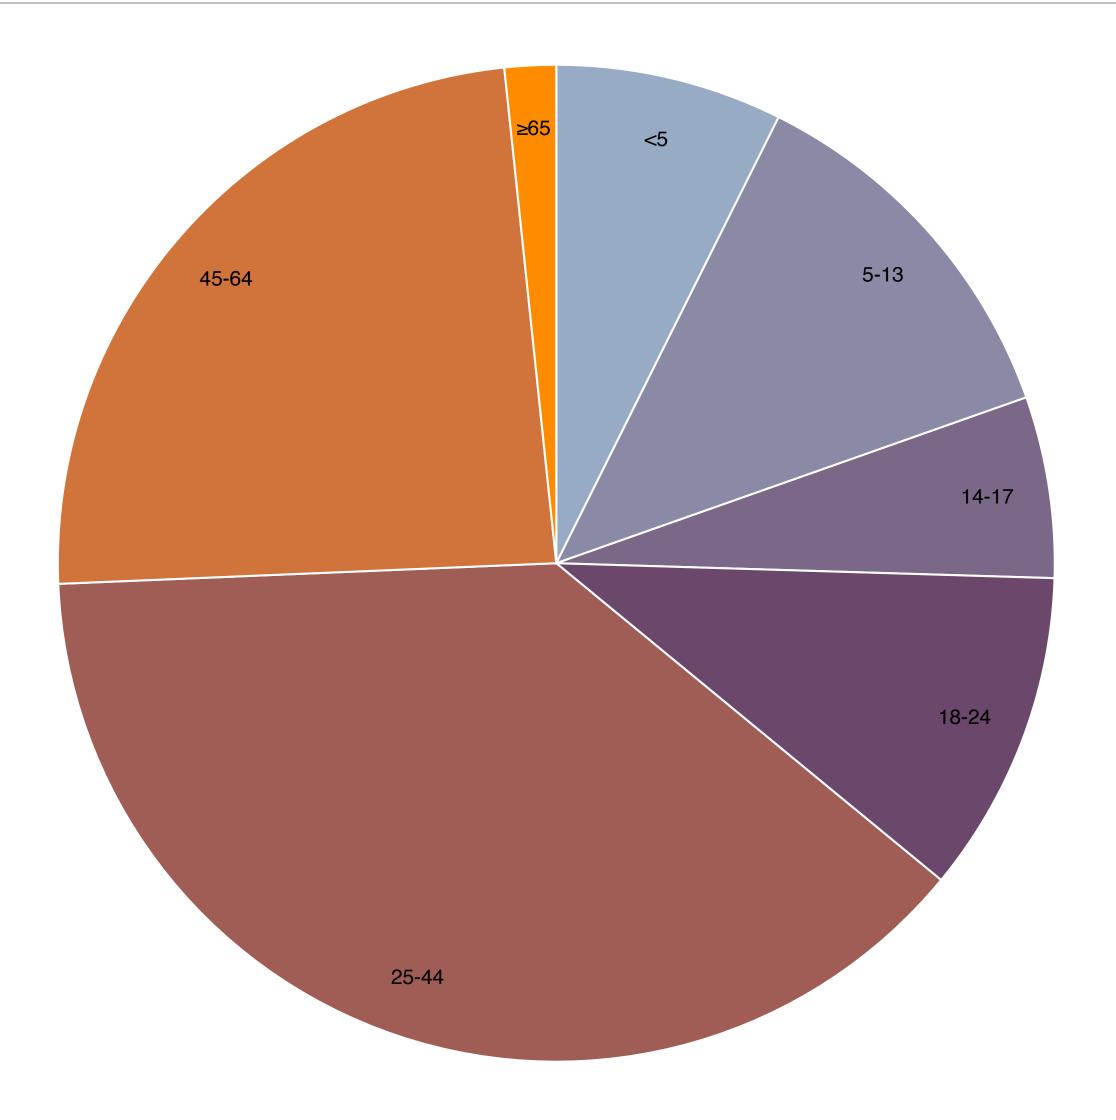

#### Normalized Stacked Bar Chart

[Normalized Stacked Bar Chart, Bostock, 2017]

#### Pie Chart

[Pie Chart, Bostock, 2017]
