Northern Illinois University

### "Duplicate Detection" has many Duplicates

### Record Linkage Process

# Record Linkage Techniques

- Deterministic matching
  - Rule-based matching (complex to build and maintain)
- Probabilistic record linkage [Fellegi and Sunter, 1969]
  - Use available attributes for linking (often personal information, like names, addresses, dates of birth, etc.)
  - Calculate match weights for attributes
- "Computer science" approaches
  - Based on machine learning, data mining, database, or information retrieval techniques
  - Supervised classification: Requires training data (true matches) - Unsupervised: Clustering, collective, and graph based

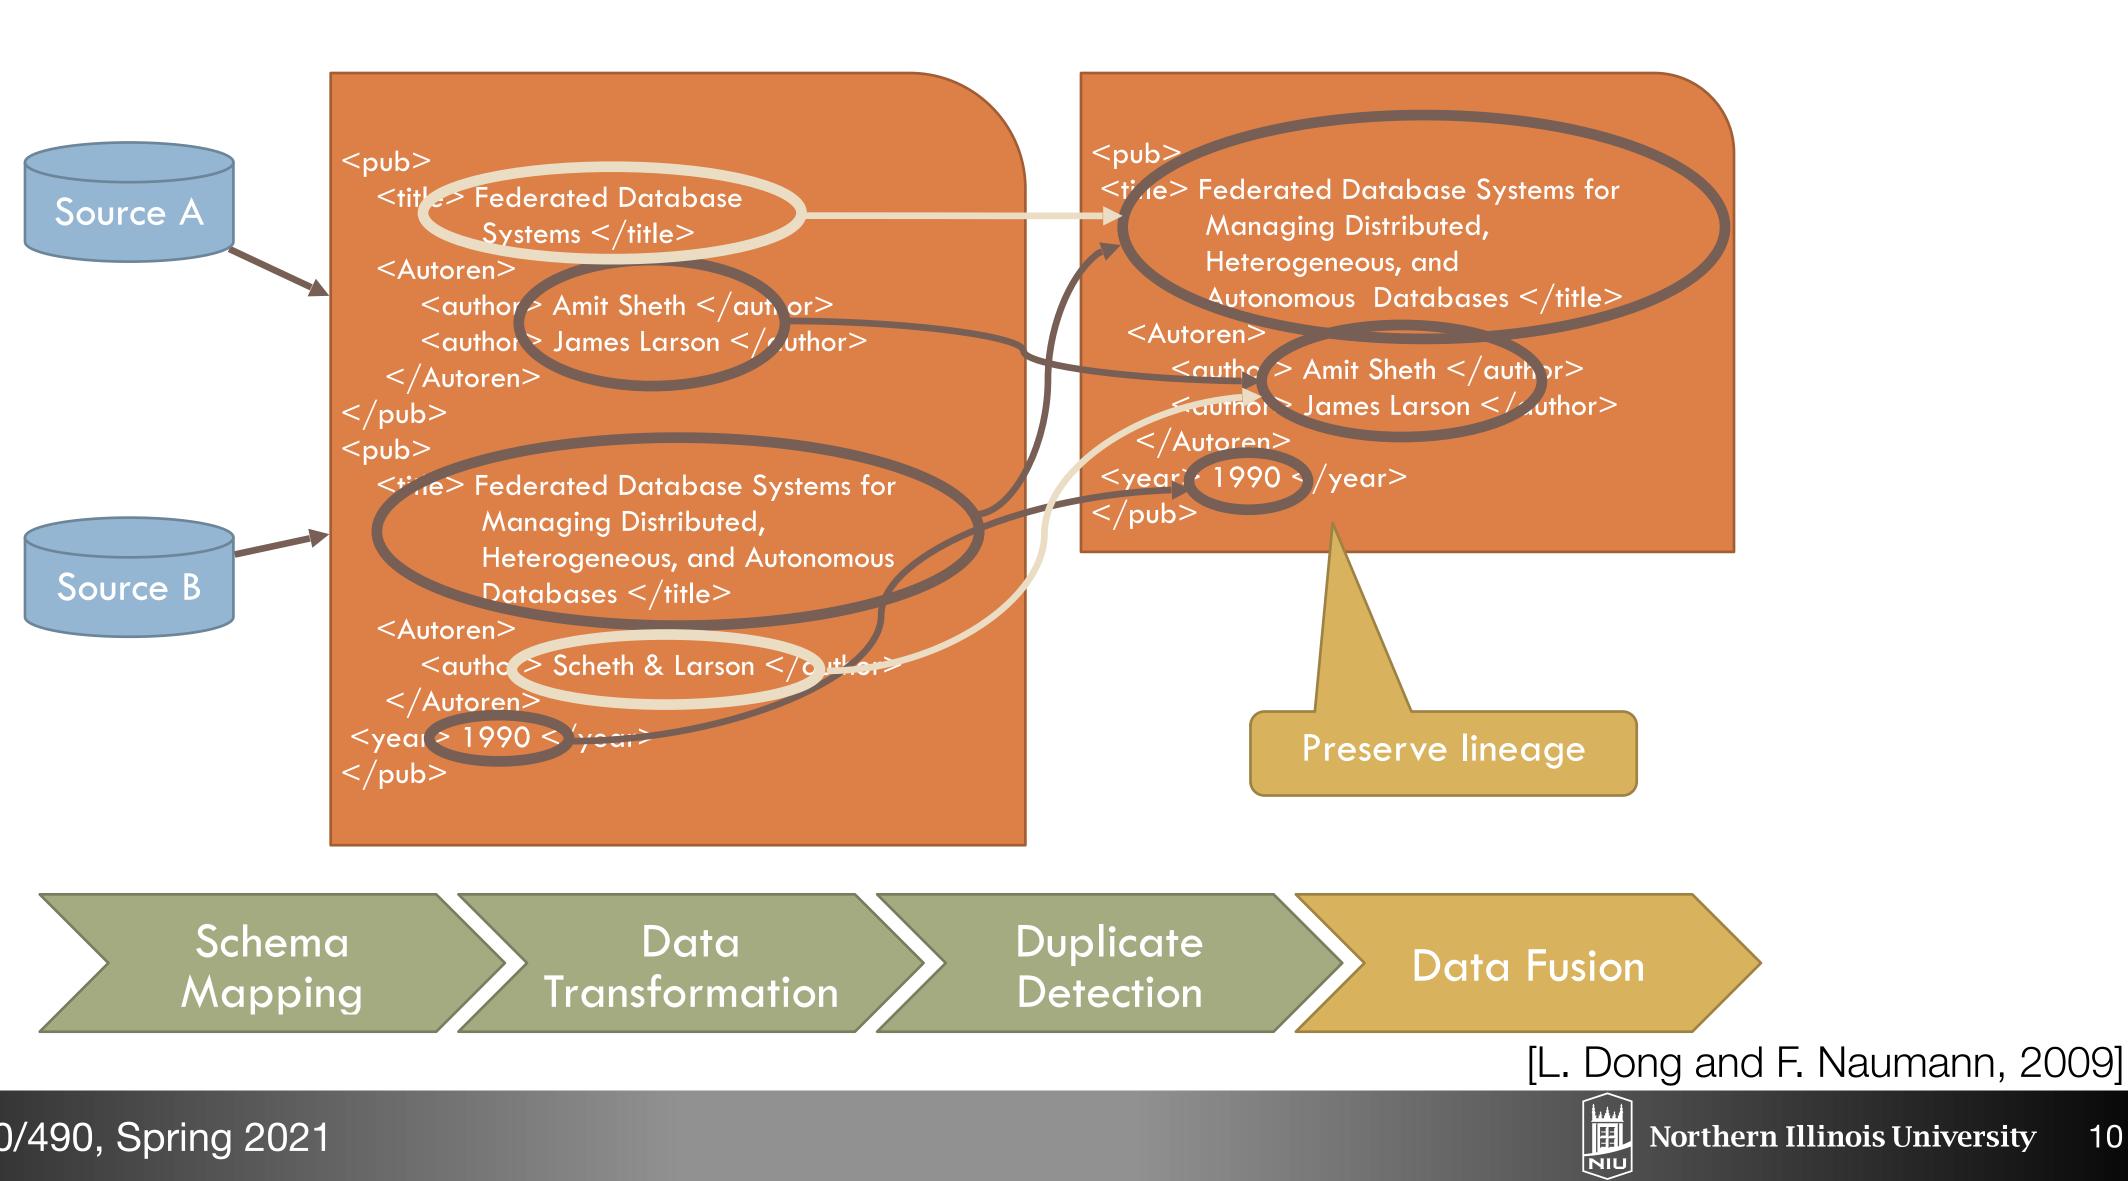

### <u>Assignment 3</u>

- Same Info Wanted data
- Data wrangling with
  - Trifacta Wrangler
  - pandas
- For place, date extraction: 2 regexs, don't try to standardize anything, CS680 need to extract place details, date is EC
- Trifacta # of Rows Issue
- Due Wednesday, March 3

D. Koop, CSCI 680/490, Spring 2021

2. With only a snapshot it is hard to decide which source is a copier.

### Source Dependence

- directly or transitively from a common source (can be one of S or T).
  - Independent source
  - Copier
    - copying part (or all) of data from other sources
    - may verify or revise some of the copied values
    - may add additional values
- Assumptions
  - Independent values
  - Independent copying
  - No loop copying

D. Koop, CSCI 680/490, Spring 2021

# Source dependence: two sources S and T deriving the same part of data

#### Core Case

- Conditions
  - Same source accuracy
  - Uniform false-value distribution
  - Categorical value
- highest probability to be true.

#### Proposition: W. independent "good" sources, Naïve voting selects values with

Northern Illinois University

#### deas

- If two sources share a lot of false values, they are more likely to be dependent.
- highly different from the accuracy of S1.

• S1 is more likely to copy from S2, if the accuracy of the common data is

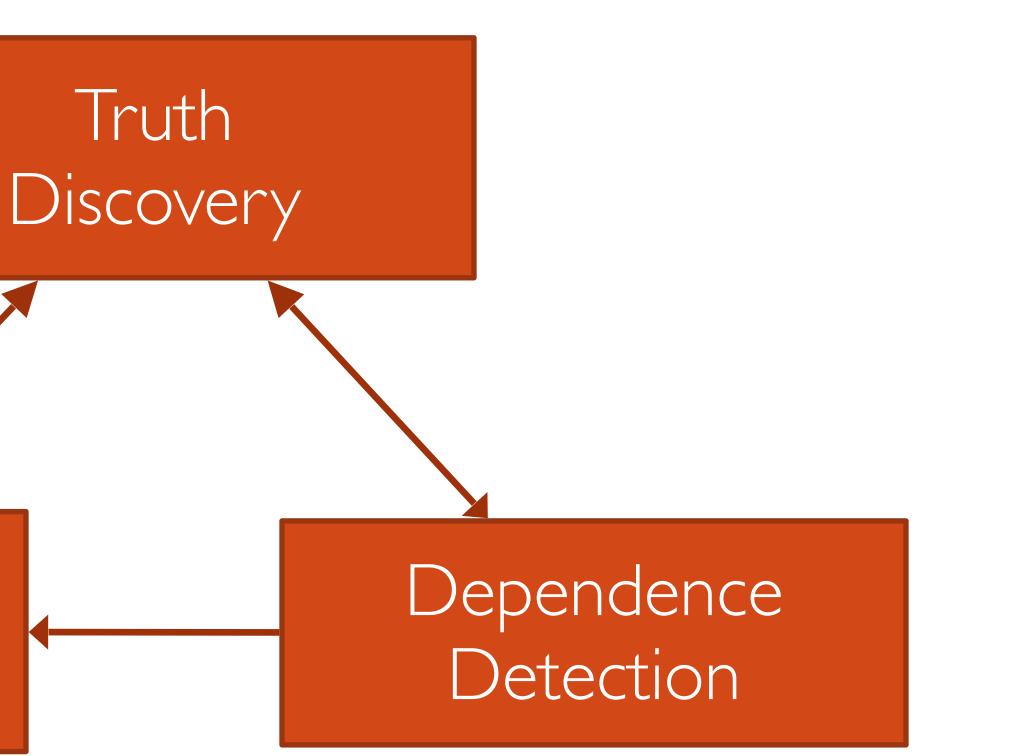

#### Combining Accuracy and Dependence

#### Source-accuracy Computation

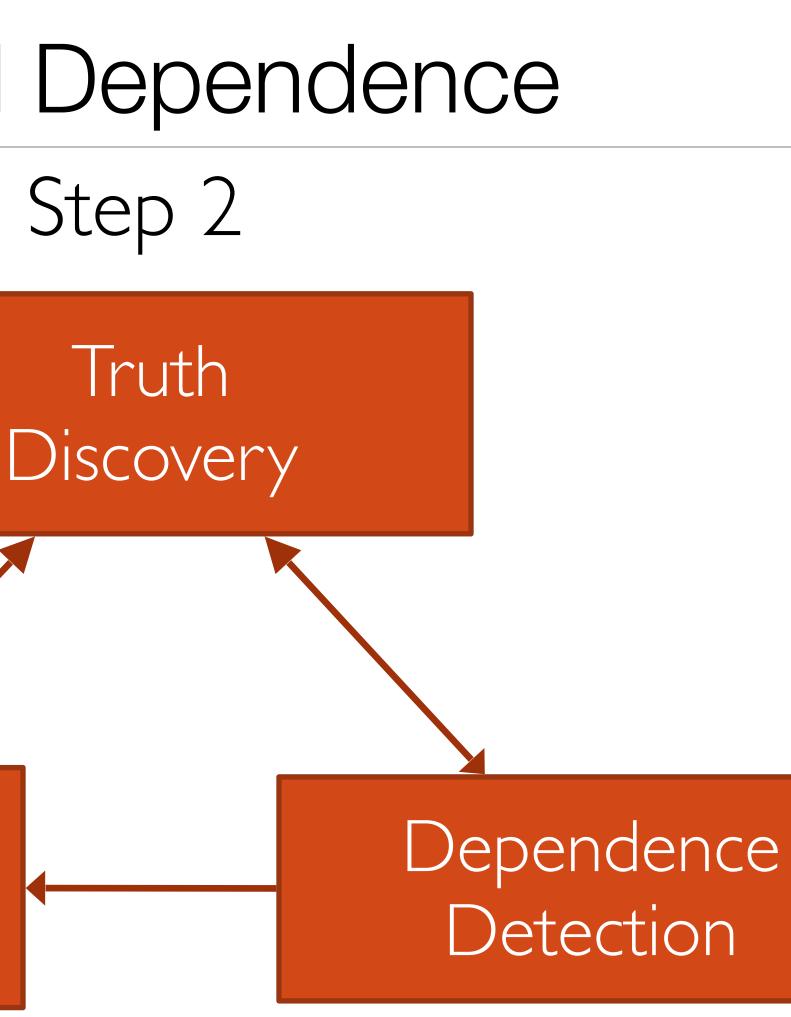

### Combining Accuracy and Dependence

Source-accuracy Computation

#### How do you find data?

#### What is a dataset?

- SDMX: a collection of related observations, organized according to a predefined structure
- DataCube (W3C): a collection of observations, possibly organized into various slices, conforming to some common dimensional structure
- Data Catalog Vocab: a collection of data, published or curated by a single agent, and available for access or download in one or more formats
- [Chapman et al., 2020]: a collection of related observations organized and formatted for a particular purpose
  - Can be table or images, graphs, documents, etc.

# Goal of Dataset Search: Accurate (A) vs. Timely (B)

## Enriched Data

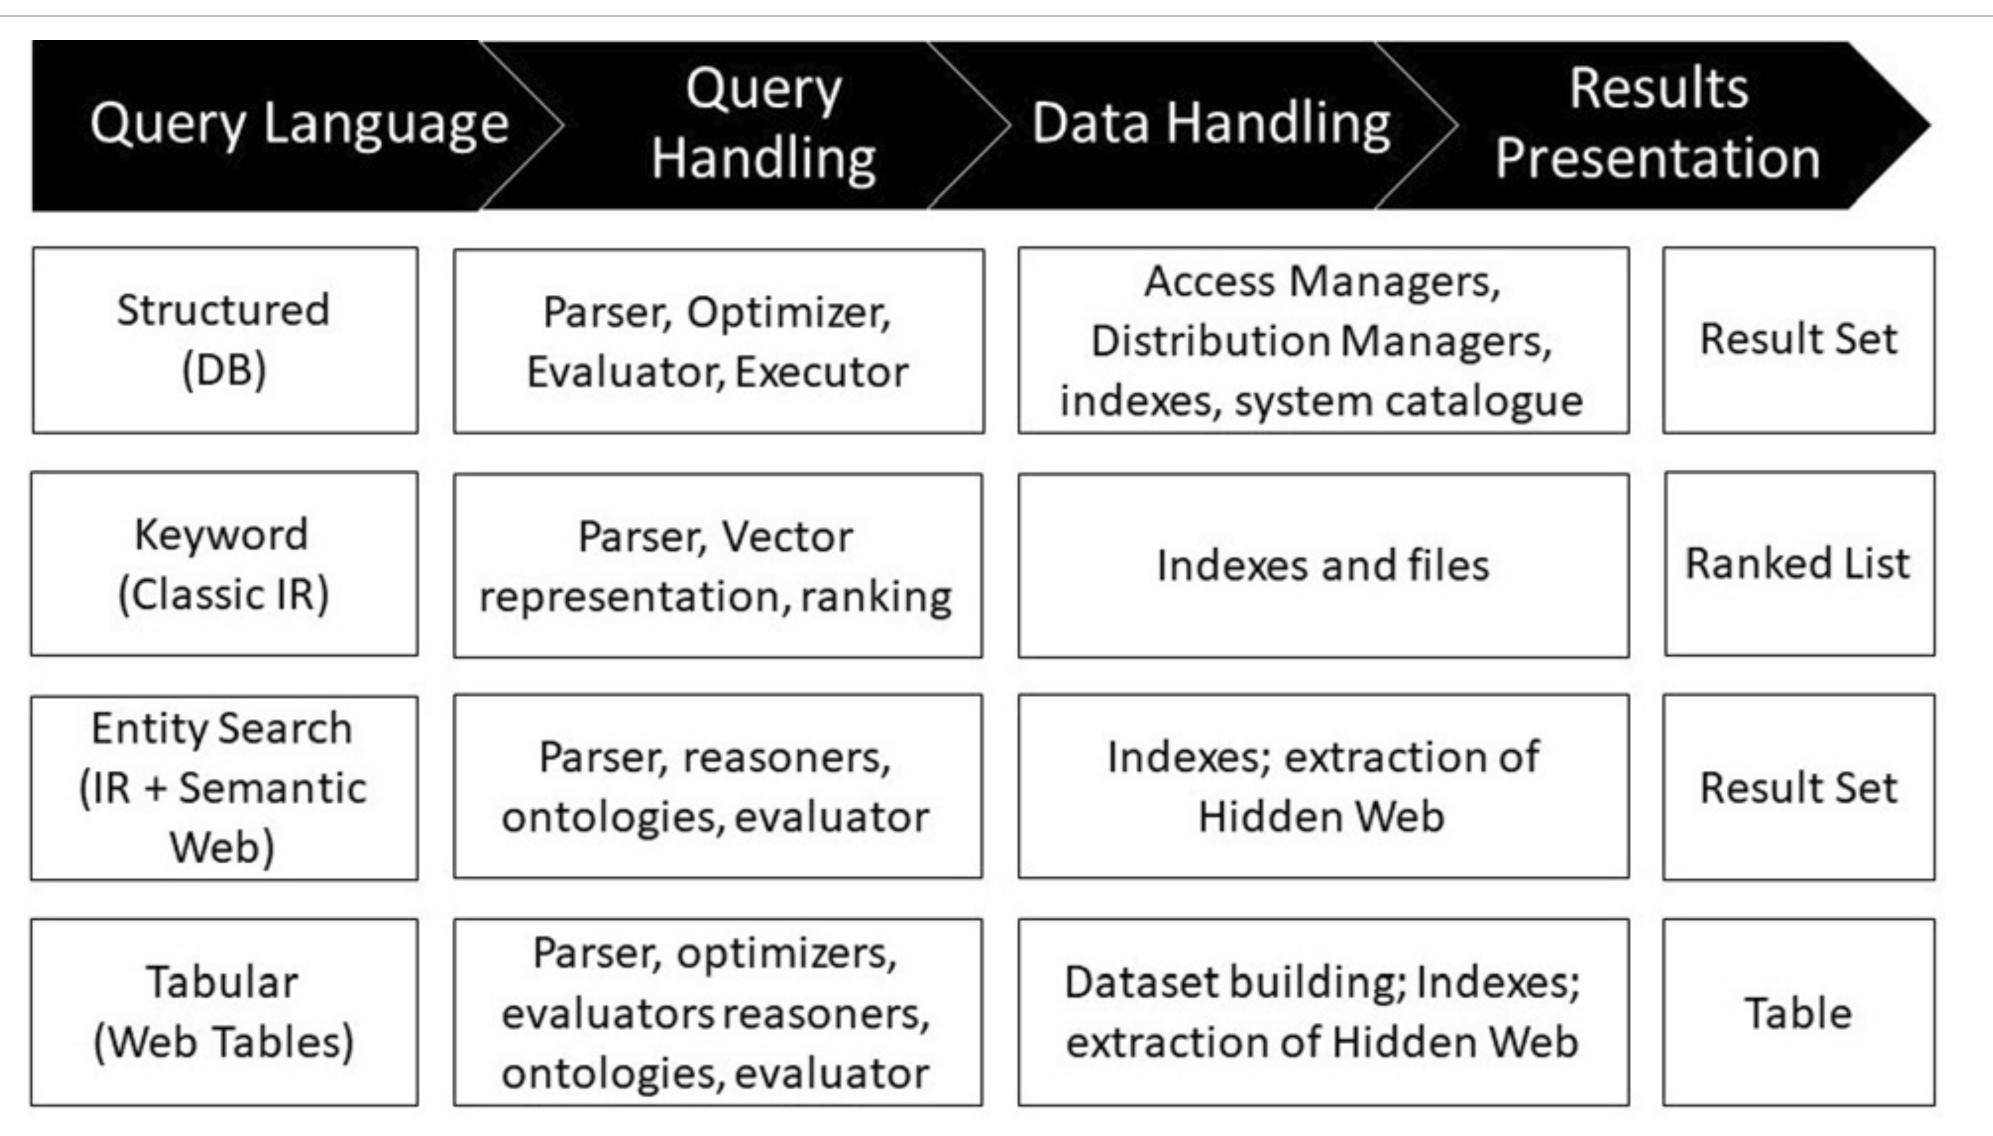

- Tagging: add searchable keywords
- Sentiment: add information about how people feel about item
- Analysis: start processing the data

## Search Process

# Goods: Organizing Google's Datasets

- Tool for Google to help its employees find internal data Keep data where it is, how it is, but extract metadata to aid search
- Challenges:
  - Dataset size and scale: >26 billion datasets
  - Variety: formats (text, csv, Bigtable), storage (GoogleFS, db server)
  - Churn: ~5% of datasets deleted each day
  - Metadata uncertainty: protocol buffers, primary key identification
  - Computing importance: need to understand users
  - Recovering semantics: understanding the data aids metadata extraction

# Goods Metadata Organization

| Metadata Groups  | Metadata                                  |
|------------------|---|
| Basic            | size, format, aliases, la                 |
| Content-based    | schema, number of rec<br>similar datasets |
| Provenance       | reading jobs, writing jo                  |
| User-supplied    | description, annotatior                   |
| Team and Project | project description, ow                   |
| Temporal         | change history                            |

# Goods: Organizing Google's Datasets

### Goods Lessons

- Need for evolution: users bookmark and annotate dataset pages,
- Ranking is domain-specific: a dataset used by another team should be higher
- Expect unusual datasets: metadata extraction can cause crashes
- Data export required: e.g. for visualization
- Ensure recoverability: expensive work so retain snapshots of data

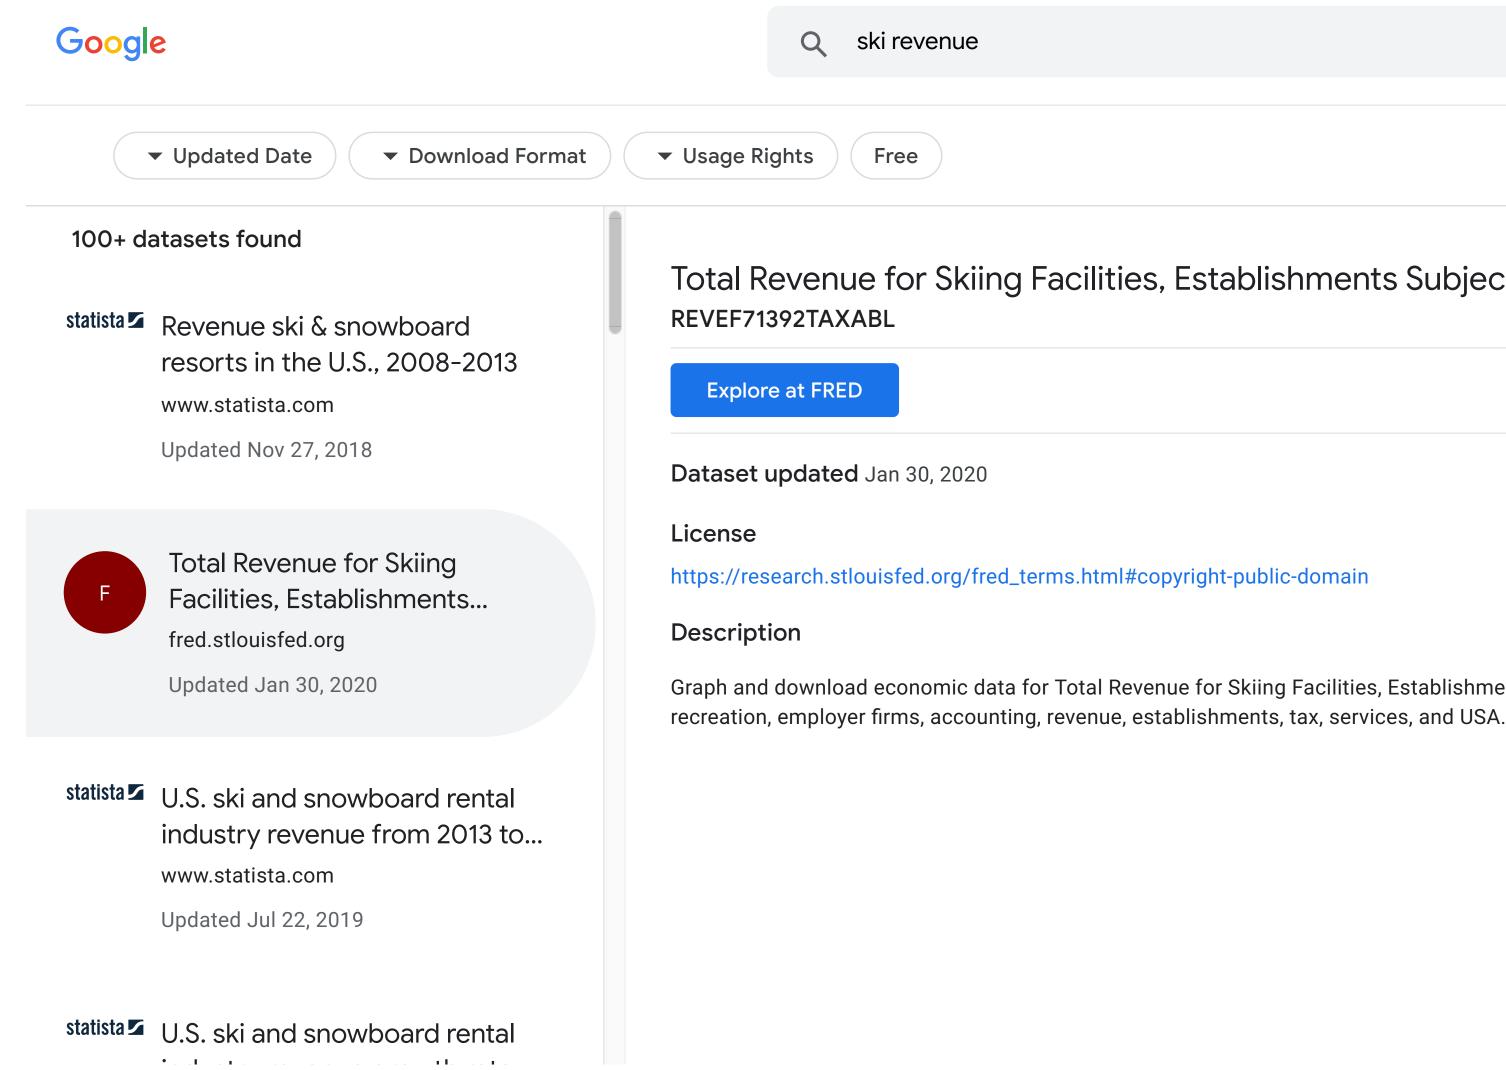

# Google Dataset Search

### D. Koop, CSCI 680/490, Spring 2021

| × | (j) [! |  |
|---|--------|--|
|   |        |  |

### Total Revenue for Skiing Facilities, Establishments Subject to Federal Income Tax, Employer Firms

Graph and download economic data for Total Revenue for Skiing Facilities, Establishments Subject to Federal Income Tax, Employer Firms (REVEF71392TAXABL) from 19

# Google Dataset Search

- Index datasets all over the web (~25 million datasets)
- Use an open standard (<u>schema.org</u>) to describe properties of dataset
- Largest topics: geosciences, biology, and agriculture
- Filter:
  - Updated date
  - Dataset format: tables, images, text
  - Usage Rights
  - Cost

## Requirements

- System must be open so new providers can add their own datasets
- Search is over metadata (a provider may require users to pay/create account)
- a standard

D. Koop, CSCI 680/490, Spring 2021

Metadata must be published by the data publishers themselves, adhering to

# Challenges

- Metadata Quality: providers don't adhere to the specs
- Metadata Duplication in Search Results: search results vs. profile pages
- Dataset Replication and Provenance: identify replicas across providers
- Churn and Stale Sites:
  - 3% deleted, 7-10% added per day
  - standard web crawlers check high-traffic sites more often
- Ranking/Relevance: data citation might help
- Multiple Dataset-Metadata Standards: <u>schema.org</u> vs DCAT

# Remaining Challenges for Dataset Search

- Query languages: moving beyond keywords
- Query handling: differentiated access
- Data handling: extra knowledge (external and dataset-intrinsic)
- Results presentation: interactivity
